

# Installation, Operation, and Maintenance Water Source Heat Pump Axiom<sup>™</sup> Horizontal/Vertical — GEH/V\*

0.5 to 25 Tons, 50/60 Hz

Model Numbers: GEHK 006-060 - 60 Hz GEVK 006-060 - 60 Hz GEHK 072-180 - 50/60 Hz GEVK 072-300 - 50/60 Hz

# A SAFETY WARNING

Only qualified personnel should install and service the equipment. The installation, starting up, and servicing of heating, ventilating, and air-conditioning equipment can be hazardous and requires specific knowledge and training. Improperly installed, adjusted or altered equipment by an unqualified person could result in death or serious injury. When working on the equipment, observe all precautions in the literature and on the tags, stickers, and labels that are attached to the equipment.

June 2025

WSHP-SVX018D-EN

# Introduction

Read this manual thoroughly before operating or servicing this unit.

# Warnings, Cautions, and Notices

Safety advisories appear throughout this manual as required. Your personal safety and the proper operation of this machine depend upon the strict observance of these precautions.

The three types of advisories are defined as follows:

injury. It could also be used to alert against unsafe

or property-damage only accidents.

### Important Environmental Concerns

Scientific research has shown that certain man-made chemicals can affect the earth's naturally occurring stratospheric ozone laver when released to the atmosphere. In particular, several of the identified chemicals that may affect the ozone laver are refrigerants that contain Chlorine, Fluorine and Carbon (CFCs) and those containing Hydrogen, Chlorine, Fluorine and Carbon (HCFCs). Not all refrigerants containing these compounds have the same potential impact to the environment. Trane advocates the responsible handling of all refrigerants.

### Important Responsible Refrigerant **Practices**

Trane believes that responsible refrigerant practices are important to the environment, our customers, and the air conditioning industry. All technicians who handle refrigerants must be certified according to local rules. For the USA, the Federal Clean Air Act (Section 608) sets forth the requirements for handling, reclaiming, recovering and recycling of certain refrigerants and the equipment that is used in these service procedures. In addition, some states or municipalities may have additional requirements that must also be adhered to for responsible management of refrigerants. Know the applicable laws and follow them.

# A WARNING

### **Proper Field Wiring and Grounding Required!**

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

### 

### Personal Protective Equipment (PPE) Required!

Failure to wear proper PPE for the job being undertaken could result in death or serious injury. Technicians, in order to protect themselves from potential electrical, mechanical, and chemical hazards, MUST follow precautions in this manual and on the tags, stickers, and labels, as well as the instructions below:

- Before installing/servicing this unit, technicians MUST put on all PPE required for the work being undertaken (Examples; cut resistant gloves/ sleeves, butvl gloves, safety glasses, hard hat/ bump cap, fall protection, electrical PPE and arc flash clothing). ALWAYS refer to appropriate Safety Data Sheets (SDS) and OSHA guidelines for proper PPE.
- When working with or around hazardous chemicals, ALWAYS refer to the appropriate SDS and OSHA/GHS (Global Harmonized System of Classification and Labelling of Chemicals) guidelines for information on allowable personal exposure levels, proper respiratory protection and handling instructions.
- If there is a risk of energized electrical contact, arc, or flash, technicians MUST put on all PPE in accordance with OSHA, NFPA 70E, or other country-specific requirements for arc flash protection, PRIOR to servicing the unit. NEVER PERFORM ANY SWITCHING, DISCONNECTING, **OR VOLTAGE TESTING WITHOUT PROPER** ELECTRICAL PPE AND ARC FLASH CLOTHING. **ENSURE ELECTRICAL METERS AND** EQUIPMENT ARE PROPERLY RATED FOR INTENDED VOLTAGE.

### A WARNING

### **Follow EHS Policies!**

Failure to follow instructions below could result in death or serious injury.

- All Trane personnel must follow the company's Environmental, Health and Safety (EHS) policies when performing work such as hot work, electrical, fall protection, lockout/tagout, refrigerant handling, etc. Where local regulations are more stringent than these policies, those regulations supersede these policies.
- Non-Trane personnel should always follow local regulations.

### A WARNING

#### R-454B Flammable A2L Refrigerant!

Failure to use proper equipment or components as described below could result in equipment failure, and possibly fire, which could result in death, serious injury, or equipment damage.

The equipment described in this manual uses R-454B refrigerant which is flammable (A2L). Use ONLY R-454B rated service equipment and components. For specific handling concerns with R-454B, contact your local representative.

### A WARNING

#### **Cancer and Reproductive Harm!**

This product can expose you to chemicals including lead and bisphenol A (BPA), which are known to the State of California to cause cancer and birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov.

### A WARNING

### Electrical Shock Hazard!

Failure to follow instructions below could result in death or serious injury.

Properly connect the system's oversized protective earthing (grounding) terminal(s).

# **Product Safety Information**

This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety. Children should be supervised to ensure that they do not play with the appliance.

Maximum altitude of use 3000 meters.

This appliance incorporates an earth connection for functional purposes only.

# **Revision History**

- Updated Model Number Description chapter.
- Removed Pump Module section (Field Installed Accessory) in General Information chapter.
- Updated Waterside economizer (GEVK) figures in Unit Dimensions chapter.
- Updated Dimensional data Waterside economizer (GEVK) tables in Unit Dimensions chapter.
- Added Waterside economizer coil piping (0.5 to 5 tons) diagram in Unit Dimensions chapter.
- Updated Ducted filter rack figure in Installation chapter.
- Updated Ducted filter opening size table in Installation chapter.
- Updated Low-voltage connection (GEH/V 6 to 25 ton) figure in Installation chapter.
- Updated Step figures 2, 3, and 5 of Waterside Economizer Installation for Vertical in Installation chapter.
- Updated Wiring diagram matrix for 0.5 to 6 tons GEV/H, EXV/H, and DXV/H models table in Wiring Diagram chapter.

# **Model Number Description**

### GEV/GEH 072–300 Models

#### Digits 1–3 — Unit Configuration

**GEH** = Standard Efficiency Horizontal 6 to 15 Tons **GEV** = Standard Efficiency Vertical 6 to 25 Tons

#### Digit 4 — Development Sequence

**K** = R-454B

#### Digits 5–7 — Nominal Capacity

072 = 6 Tons 090 = 7.5 Tons 120 = 10 Tons 150 = 12.5 Tons 180 = 15 Tons 240 = 20 Tons 300 = 25 Tons

#### Digit 8 — Voltage (Volts/Hz/Phase)

- **1** = 208/60/1
- **2** = 230/60/1
- 3 = 208/60/3
- **4** = 460/60/3
- **5 =** 575/60/3
- **8** = 230/60/3 **9** = 380-415/50/3

#### Digit 9 — Heat Exchanger

- 1 = Copper-Water Coil
- 2 = Cupro-Nickel Water Coil
- 7 = Insulated Copper-Water Coil
- 8 = Insulated Cupro-Nickel Water Coil

#### Digit 10 — Current Design Sequence

#### Digit 11 — Refrigeration Circuit

**0** = Heating and Cooling Circuit

- **2** = Heating and Cooling Circuit with Hot Gas Reheat
- **3** = Heating and Cooling Circuit with Waterside Economizer

**4** = Heating and Cooling Circuit with HGR and WSE

C = Drive Package C D = Drive Package D E = Drive Package E F = Drive Package F G = Drive Package G H = Drive Package H J = Drive Package J 1 = 2 Speed Drive Package A 2 = 2 Speed Drive Package D 5 = 2 Speed Drive Package E 6 = 2 Speed Drive Package F 7 = 2 Speed Drive Package G 8 = 2 Speed Drive Package G 7 = 2 Speed Drive Package G 7 = 2 Speed Drive Package G 8 = 2 Speed Drive Package G 7 = 2 Speed Drive Package G 8 = 2 Speed Drive Package H

9 = 2 Speed Drive Package J

#### Digit 13 — Freeze Protection

**A** = 20°F Freezestat (For Glycol loop) **B** = 35°F Freezestat (For Water loop)

#### Digit 14 — Open Digit = 0

#### Digit 15 — Supply-Air Arrangement

- B = Back Supply-Air Arrangement
- **F** = Front Supply-Air Arrangement
- L = Left Supply-Air Arrangement
- **R** = Right Supply-Air Arrangement
- T = Top Supply-Air Arrangement

#### Digit 16 — Return-Air Arrangement

- B = Back Return-Air Arrangement
- F = Front Return-Air Arrangement
- L = Left Return-Air Arrangement
- R = Right Return-Air Arrangement

#### Digit 17 — Control Types

- D = Deluxe 24V Controls
- F = Symbio™ 500
- G = Symbio 500/with Air-Fi® Wireless

#### Digit 18 — Tstat/Sensor Location

0 = Wall Mounted Location

#### Digit 19 — Fault Sensors

- 1 = Condensate Overflow Sensor
- 3 = Condensate Overflow and Filter Maintenance Timer
- 6 = Condensate Overflow and Fan Status
- J = Fan Status, Filter Maintenance Timer and

#### Condensate Overflow Sensor

#### Digit 20 — Temperature Sensor

- 0 = No Temperature Sensor
- 1 = Entering Water Sensor

#### Digit 21 — Insulation

1 = Standard Fiberglass Insulation

#### Digit 22 — Electric Heat

- 0 = No Electric Heat
- 4 = External Boilerless Electric Heat
- 5 = External Supplemental Electric Heat

#### Digit 23 - ON/OFF Switch

0 = No ON/OFF Switch

#### Digit 24 — Filter Type

- 1 = 1-inch Throwaway Filter
- 2 = 2-inch Throwaway Filter
- 4 = 2-inch MERV 8
- 5 = 2-inch MERV 13

#### Digit 25 — Acoustic Arrangement

0 = Enhanced Sound Attenuation

### Digits 26–34 — Does Not Apply to GEH or GEV

**0000000000 =** Digits 26-36 are not applicable to the GEH or GEV products

#### Digits 35 — Unit Drain Pan Option

A = Polymer Drain Pan

B = Stainless Steel Drain Pan

#### Model Number Notes

Note: 20°F Freezestat is typically used in a geothermal application. 35°F Freezestat is typically used in a boiler/tower application.

#### Digit 12 — Blower Configuration

A = Drive Package A

B = Drive Package B

### GEV/GEH 006-060 Models

Digits 1–3 — Unit Configuration	Digit 12 — Blower Configuration	Digit 22 — Electric Heat Option
GEH = Standard Efficiency Horizontal	K = Variable ECM Motor, Constant Torque	0 = No Electric Heat

<b>4</b> = 460/60/3 <b>7</b> = 265/60/1	Digit 17 — Control Types	2 = Deluxe Sound Attenuation
<b>A</b> = 208-230/60/1	D = Deluxe 24V Controls	Digits 26–36 — Does Not Apply
<b>B</b> = 208-230/60/3	H = Symbio 400-B	
Digit 9 — Heat Exchanger	J = Symbio 400-B/with Air-Fi® Wireless Communications	<b>00000000000 =</b> Digits 26-36 are not applicable to the GEH or GEV products
1 = Copper-Water Coil 2 = Cupro-Nickel Water Coil	Digit 18 — Tstat/Sensor Location	Digit 37 — Ducted Filter Rack
7 = Insulated Copper-Water Coil/Suction Line	<b>0</b> = Wall Mounted Location	0 = Non-ducted Filter Rack
8 = Insulated Cupro-Nickel Water Coil/Suction Line		A = Ducted Filter Rack (Side Access/LH—RH)
Digit 10 — Design Sequence	Digit 19 — Fault Sensors	<b>C</b> = Ducted Filter Rack (Bottom Access)
Digit IV — Design Dequence		Digit 38 — Isolation Valve
A First Design Sequence	1 = Condensate Overflow Sensor	-
	<b>3</b> = Condensate Overflow and Filter Maintenance	0 = No Isolation Valve
Digit 11 — Refrigeration Circuit		1 = Factory Mounted Isolation Valve
	6 = Condensate Overflow and Fan Status J = Fan Status, Filter Maintenance Timer and	Digit 39 — Power Connection
<b>0</b> = Heating and Cooling Circuit	Condensate Overflow Sensor	
<b>2</b> = Heating and Cooling Circuit with Hot Gas Reheat	Digit 20 — Temperature Sensor	1 = Single Point
<b>3</b> = Heating and Cooling Circuit with Waterside	3	2 = Electric Heat Power Separate from Unit
Economizer	0 = No Additional Temperature Sensor	Digit 40 Droin Bon
4 = Heating and Cooling Circuit with Waterside	1 = Entering Water Sensor	Digit 40 — Drain Pan
Economizer, Hot Gas Reheat	Digit 21 — Insulation	A = Polymer Drain Pan
	1 = Matte Faced Insulation	B = Stainless Steel Drain Pan
	2 = Foil Faced Insulation	Model Number Note:
		Note: 20°F Freezestat is typically used in a geothermal application. 35°F Freezestat is

typically used in a boiler/tower application.

# **Overview of Manual**

**Note:** One copy of this document ships inside the control panel of each unit and is customer property. It must be retained by the unit's maintenance personnel.

This booklet describes proper installation, operation, and maintenance procedures for air cooled systems.

By carefully reviewing the information within this manual and following the instructions, the risk of improper operation and/or component damage will be minimized.

It is important that periodic maintenance be performed to help assure trouble free operation. A maintenance schedule is provided at the end of this manual.

Should equipment failure occur, contact a qualified service organization with qualified, experienced technicians to properly diagnose and repair this equipment.

# **Unit Nameplate**

The unit nameplate is located on the outside of the control box access panel at the front of the unit. It includes the unit model number, serial number, electrical characteristics, refrigerant charge, and other pertinent unit data.

### **Compressor Nameplate**

The nameplate for the compressors are located on the compressor shell.

# **Model Number Description**

All products are identified by a multiple-character model number that precisely identifies a particular type of unit. Its use will enable the owner/operator, installing contractors, and service engineers to define the operation, specific components, and other options for any specific unit.

When ordering replacement parts or requesting service, be sure to refer to the specific model number and serial number printed on the unit nameplate.

# **General Information**

# **Unit Description**

Before shipment, each unit is leak tested, dehydrated, charged with refrigerant, and run tested for proper control operation.

# Air-to-Refrigerant Coil

The air-to-refrigerant coil is aluminum fin, mechanically bonded to the copper tubing.

# Water-to-Refrigerant Coil

The water-to-refrigerant coil is a copper or cupro-nickel (option) and steel tube (tube-within-a-tube) design, leak tested to confirm there is no cross leakage between the water tube (copper/cupro-nickel) and refrigerant gas (steel tube).

Table 1. High/low pressure s	switch
------------------------------	--------

	Trip	Recover	Unit
LP	40 +/-4	56 +/-4	psig
HP	600 +/-10	550 +/-10	psig

Additives like glycol can be added to reduce the freezing point of the water. Units are not intended to be connected to sanitary water.

- Entering water temperatures range from 25°F to 120°F.
- Leaving water temperature deltas range from 10°F to 15°F.
- · Maximum water pressure allowed in system is 400 psi.

# Controls

The available control type is a Deluxe 24V control option or Symbio<sup>™</sup> 400-B/500 BACnet® control option for all unit sizes.

All power wiring to the equipment is made at the unit's compressor contactor or the optional disconnect switch for GEH/V 0.5 to 5 ton. For units without the disconnect switch, the power wiring needs to be connected to the screw terminals of the compressor contactor. For the GEH/V 6 to 25 tons units all power wiring is made to the high voltage terminal block. All low-voltage wiring is made at the unit's low voltage terminal board or terminal plug.

# System Input Devices and Functions

A thermostat, zone sensor, or building automation system is required to operate the water-source heat pump. The flexibility of having several mode capabilities depends upon the type of sensor and/or remote panel selected. Troubleshooting and connection diagrams for the 24V control systems may be located in the back of this manual. All digital control troubleshooting tips and connection diagrams are located in *Symbio™ 400–B/500 Programmable Controllers Water Source Heat Pump (WSHP) Installation, Operation, and Maintenance* (BAS-SVX092\*-EN).

# **Deluxe 24V Controls (Option)**

Units containing the Deluxe 24V control design will incorporate a microprocessor-based control board. The Trane microprocessor board is factory wired to a terminal strip or terminal plug to provide all necessary terminals for field connection. The deluxe board is equipped with a random start relay, anti-short cycle timer, brown out protection, compressor disable, condensate overflow, unit safety control, diagnostics, and a generic relay (which may be available for field use).

# Symbio<sup>™</sup> 400-B/500 (option)

The Symbio 400-B/500 is a BTL Listed BACnet® controller that can operate stand- alone or within a Building Automation System (BAS) such as Tracer® SC+. See Symbio™ 400–B/500 Programmable Controllers Water Source Heat Pump (WSHP) Installation, Operation, and Maintenance (BAS-SVX092\*-EN).

# Waterside Economizer (Option)

Instructions for mechanical connection of the waterside economizer to the water-source heat pump may be found in the dimensional section of this manual.

The waterside economizer is designed to begin economizing mode when water temperatures fall below the field adjustable temperature of 25, 35, 45, 55 or 60°F (for the Deluxe control option), or below the programmed setpoint (for the Symbio<sup>TM</sup> 400-B/500 control option).

When the temperature is less than the setpoint, fluid will flow into the economizing coil, while simultaneously halting mechanical operation of the compressor. Mechanical cooling will continue on a call for a second stage from the thermostat or system control. Entering water temperature sensor is factory provided for field installation on the entering water side of the coil.

# Boilerless Control/Electric Heat (Option)

This option targets building designs that do not incorporate a boiler to heat the loop system. During a heavy heating load, the loop temperature may begin to fall. As the loop temperature decreases, the heating capacity of the heat pump also decreases. In the heating mode, when the loop temperature falls below 55°F (factory setting), the electric

heater is energized, and the compressor is locked out. The system's electric heat source is utilized for primary heating until the loop temperature rises above 60°F. Once the loop temperature rises above 60°F, the boilerless controller returns the unit to normal compressor heating operation and locks out the electric heater.

The electric heat must be field installed by the contractor. See *Electric Heat and 575V Water Source Heat Pump 0.5* to 6 Tons Installation Instructions (WSHP-SVN011\*-EN) for more information.

Note: The boilerless controller has a field adjustable entering water temperature setting of 25, 35, 45, 55, and 60 degrees. The compressor operation will return to normal operation when the loop temperature rises 5 degrees above the setpoint. This electric heat option is designed for primary heat only, not to run as supplemental heat to the heating function of the heat pump.

# Supplemental or Boilerless Electric Heat (Option)

Only available on GEH/V 6 to 25 ton units.

Supplemental heat turns on automatically when heat pump cannot provide sufficient heat to meet the heating load. The electric heat is energized to supplement the heating provided by the heat pump. The heater is external to the equipment. For the GEH/V 6 to 25 ton units, the electric heat must be field installed by the contractor.

### Hot Gas Reheat (Option)

With the reheat option, the return-air from the space is conditioned by the air-to-refrigerant coil, then reheated by the reheat coil to control not only the space temperature, but to also reduce the relative humidity of the space. When operating in the reheat mode, the humidistat signals the reheat relay coil to energize, allowing the high pressure refrigerant gas to flow from the compressor through the reheat valve, into the reversing valve and reheat coil.

A switching is provided for the reheat application to adjust the blower motor from normal operation to low speed when the hot gas reheat is energized (for 0.5 to 5 ton equipment only).

**Note:** Units containing the hot gas reheat option should not be used as a make-up air unit.

# 2-Speed Blower Motor (Option)

The 6 to 25 ton GEH/V models have indoor blowers that are available with 2 speed motors, selectable in the model number (Digit 12, drive packages one to nine). High speed airflow matches the single speed motor airflow, referenced in the Fan Performance tables. Low fan speed airflow is approximately 50% of high fan speed airflow.

The 6 to 25 ton GEH/V two-speed blower motors are available with the following options: Deluxe 24V or Symbio™ 500 controls, Heat Pump (HP) or HP w/Hot Gas Reheat or HP w/Waterside Economizer. They are not available with Boilerless or Supplemental Electric Heat.

Table 2.	6 to 25 ton GEH/V	fan speed for two-spee	ed drive packages one to nine
----------	-------------------	------------------------	-------------------------------

RV State	Fan	Compressor 1	Compressor 2	Fan Speed

# **Operating Limits**

#### Table 4. Operating limits - 0.5 to 25 tons

Operating Limits	Cooling	Heating				
	Air Limits					
Min. ambient air DB	45°F	- (7°C)				
Max. ambient air DB	130°F	(54.4°C)				
Min. EAT DB/WB	70.0/50.0°F (21.1/10.0°C)	55.0°F/- (12.8°C/-)				
Max. EAT DB/WB	85.0/78.0°F (29.4/25.6°C)	80.0°F/- (26.6°C/-)				
Airflow range	) CFM/ton <sup>(a)</sup>					
	Water Limits					
Min. entering water temperature	45°F (7°C)	25°F (-4°C)				
Max. entering water temperature	120°F (49°C)	86°F (30°C)				
Max. water pressure	400 PSIG (2758 kPa)					
Water flow range	1.55 to 3.50 GPM/ton <sup>(a)</sup>					

(a) This value is an average and varies per model. See performance tables for each model number's rated values.

# **Pre-Installation**

### 

### Fiberglass Wool!

Exposure to glass wool fibers without all necessary PPE equipment could result in cancer, respiratory, skin or eye irritation, which could result in death or serious injury. Disturbing the insulation in this product during installation, maintenance or repair will expose you to airborne particles of glass wool fibers and ceramic fibers known to the state of California to cause cancer through inhalation.

You MUST wear all necessary Personal Protective Equipment (PPE) including gloves, eye protection, a NIOSH approved dust/mist respirator, long sleeves and pants when working with products containing fiberglass wool.

**Precautionary Measures:** 

- Avoid breathing fiberglass dust.
- Use a NIOSH approved dust/mist respirator.
- Avoid contact with the skin or eyes. Wear longsleeved, loose-fitting clothing, gloves, and eye protection.
- Wash clothes separately from other clothing; rinse washer thoroughly.
- Operations such as sawing, blowing, tear-out, and spraying may generate fiber concentrations requiring additional respiratory protection. Use the appropriate NIOSH approved respirator.

First Aid Measures:

- Eye Contact Flush eyes with water to remove dust. If symptoms persist, seek medical attention.
- Skin Contact Wash affected areas gently with soap and warm water after handling.

# **Unit Inspection Checklist**

- **Note:** The packaging for these units are tested per, and compliant with, the requirements of NMFC Item 180 Certified Packaged Products.
- · Unpack all components of the kit.
- Check carefully for any shipping damage. If any damage is found it must be reported immediately and a claim made against the transportation company.
  - *Important:* Equipment is shipped FOB (Free on Board) at the manufacturer. Therefore, freight claims for damages against the carrier must be initiated by the receiver.

- Visually inspect the components for shipping damage as soon as possible after delivery, before it is stored. Concealed damage must be reported within 15 days.
- If concealed damage is discovered, stop unpacking the shipment.
- Do not remove damaged material from the receiving location. Take photos of the damage, if possible. The owner must provide reasonable evidence that the damage did not occur after delivery.
- Notify the carrier's terminal of damage immediately by phone and by mail. Request an immediate joint inspection of the damage by the carrier and the consignee.
- Do not attempt to repair any damaged parts until the parts are inspected by the carrier's representative.

# **Jobsite Inspection Checklist**

Always perform the following checks before accepting a unit:

- Verify that the nameplate data matches the data on the sales order and bill of lading (including electrical data).
- Verify that the power supply complies with the unit nameplate specifications.
- Visually inspect the exterior of the unit, for signs of shipping damage. Do not sign the bill of lading accepting the unit(s) until inspection has been completed. Check for damage promptly after the unit(s) are unloaded. Once the bill of lading is signed at the jobsite, the unit(s) are now the property of the SOLD TO party and future freight claims MAY NOT be accepted by the freight company.

# Jobsite Storage

### A WARNING

**Risk of Fire — Flammable Refrigerant!** 

Failure to follow instructions below could result in death or serious injury, and equipment damage. The equipment shall be stored in a room without continuously operating ignition sources.

### NOTICE

### Microbial Growth!

Failure to follow instructions below could result in odors and damage to the equipment and building materials.

The floor or foundation must be level and the condensate drain at the proper height for proper drainage and condensate flow. Standing water and wet surfaces inside the equipment can become an amplification site for microbial growth (mold). If there is evidence of microbial growth on the interior insulation, it should be removed and replaced prior to operating the system.

This unit is intended for indoor use only. To protect the unit from damage due to the elements, and to prevent possible IAQ contaminant sources from growing, the unit should be stored indoors. If indoor storage is not possible, the following provisions for outdoor storage must be met:

- Place the unit(s) on a dry surface or raise above the ground to assure adequate air circulation beneath the unit.
- Cover the unit(s) with a water proof tarp to protect them from the elements.
- Make provisions for continuous venting of the covered units to prevent moisture from standing on the unit(s) surfaces. Wet interior unit insulation can become an amplification site for microbial growth (mold) which has been determined to be a cause of odors and serious health related indoor air quality problems.
- Store units in the normal UP orientation to maintain oil in the compressor.
- Stack horizontal units no more than three units high. Do not stack the vertical unit configurations.

# **Unit Dimensions**

### Service Clearances

Per NEC requirements, 36-inches of access and working space is provided and maintained around all control boxes and electrical equipment to permit ready and safe

#### Figure 1. Clearances - GEH 0.5 to 5 tons

operation and maintenance of such equipment. Local codes may require more clearance to electrical equipment. Check all code requirements prior to unit installation.

A minimum 14-inch clearance for servicing the unit is required for all 0.5 to 5 tons configurations from other mechanical and electrical equipment (where shown) to enable panel removal from the unit for service/maintenance ability. The optimum clearance required is 20-inches.

Notes:

- Return air direction (left-hand or right hand) is NOT field convertible. Units must be ordered with correct return air side.
- For horizontal models, be sure to allow enough clearance between the condensate drain and the ceiling to allow for pitching of the condensate line. See, p. for pitching requirements.

Figure 2. Clearance - GEH 6 to 15 tons

Service clearance dimensions for the GEH 6 to15 tons horizontal includes a two-side access appropriate for control and blower motor/wheel access.

**Note:** For horizontal models, confirm enough clearance between the condensate drain and the ceiling for pitching of the condensate line. See , p. for pitching requirements.

Figure 3. Clearance – GEV 0.5 to 5 tons

Figure 4. Clearance - GEV 6 to 10 tons

Figure 5. Clearance - GEV 12.5 to 25 tons

A 24-inch clearance from other mechanical and electrical equipment (where shown) is recommended for most unit configurations. This will enable panel removal from the unit for service/maintenance.

The 24-inch side clearance on GEVK 0.5 to 5T models is for optimal access only. Side clearance is not a requirement as most components can be accessed from the front of the unit.

A 1-inch minimum clearance between the filter rack and any obstacle is required for units in a free return application to provide proper air flow to the air-to-refrigerant coil. A 12-inch minimum clearance between the filter rack and any obstacle should be provided to properly attached ductwork. The 1-inch dimension shown in the back of the unit represents the supply duct collar for the back supply option. This clearance is needed to clear these flanges.

A 24-inch clearance from other mechanical and electrical equipment (where shown) is recommended for all configurations. The unit may be serviced through the front access panel or remaining open sides.

A 24-inch clearance from other mechanical and electrical equipment (where shown) is recommended for all configurations. The unit may be serviced through the front access panel.

# Weight Distribution for Hanging the GEH Model

## A WARNING

#### Improper Unit Lift!

Failure to properly lift unit in a LEVEL position could result in unit dropping and possibly crushing operator/technician which could result in death or serious injury, and equipment or property-only damage.

Test lift unit approximately 24 inches (61 cm) to verify proper center of gravity lift point. To avoid dropping of unit, reposition lifting point if unit is not level. Approximate weight distribution for proper hanging of the unit is indicated by weight distribution in the figure below. Tolerance on the weights determined are  $\pm 15\%$ .

#### Figure 44. Weight distribution GEH 0.5 to 5 tons

# **A2L Information and Installation Requirements**

## Installation/Code Compliance Requirements

Building level controls may need to be upgraded/modified to demand leak mitigation actions as described in "Leak Detection System (Refrigerant charge greater than 3.91 lb per circuit)," p. 59. Those actions include, but are not limited to, fully opening damper and VAV boxes (if present), and disabling electric heat in VAV boxes (if present).

Verify the equipment refrigerant charge is in accordance with the room area limitation as described in Minimum Room Area Limits section.

Ensure that there are labels on the equipment stating it contains a flammable refrigerant.

## A2L Work Procedures

## **A** WARNING

**Risk of Fire — Flammable Refrigerant!** Failure to follow instructions below could result in death or serious injury, and equipment damage.

- To be repaired only by trained service personnel.
- Do not puncture refrigerant tubing.
- Dispose of properly in accordance with federal or local regulations.
- The equipment shall be stored in a room without continuously operating ignition sources.

## A WARNING

## **Refrigerant under High Pressure!**

Failure to follow instructions below could result in an explosion which could result in death or serious injury or equipment damage.

System contains refrigerant under high pressure. Recover refrigerant to relieve pressure before opening the system. See unit nameplate for refrigerant type. Do not use non-approved refrigerants, refrigerant substitutes, or refrigerant additives.

## A WARNING

#### Hazardous Voltage!

Failure to disconnect power before servicing could result in death or serious injury.

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/ tagout procedures to ensure the power can not be inadvertently energized. Verify that no power is present with a voltmeter. The units described in this manual use R-454B refrigerant. Use ONLY R-454B rated service equipment or components with these units. For specific handling concerns with R-454B, contact your local Trane representative.

Installation, repair, removal, or disposal should be performed by trained service personnel.

At all times, Trane's maintenance and service guidelines shall be followed. If in doubt, contact Trane technical support for assistance.

## Servicing

Prior to initiating work on equipment, check the area with an appropriate refrigerant detector. Ensure the service personnel are properly trained regarding work in potentially toxic or flammable atmospheres. Ensure that the leak detection equipment being used is suitable for use with all applicable refrigerants, i.e. non-sparking, adequately sealed, or intrinsically safe. Be aware that the refrigerant does not contain an odor.

If any hot work is to be conducted on the refrigerating equipment or any associated parts, appropriate fire extinguishing equipment shall be available on hand. A dry powder or  $CO_2$  fire extinguisher should be located adjacent to the charging area.

At all times, Trane's maintenance and service guidelines shall be followed. If in doubt, contact Trane technical support for assistance.

All maintenance staff and others working in the local area shall be instructed on the nature of the work being carried out. Work in confined spaces shall be avoided.

#### **Ignition Source Mitigation**

Do not use any sources of ignition when working on the refrigeration system.

Keep all ignition sources, including cigarette smoking, away from the site of installation, repair, removal or disposal, during which refrigerant can potentially be released to the surrounding space.

Survey the area around the equipment before initiating work to ensure no flammable hazards or ignition risks are present.

"No Smoking" signs shall be displayed.

Do not use devices that can be a source of ignition to accelerate defrosting of components. Use only defrost and cleaning procedures recommended by Trane. Do not pierce or burn.

#### Ventilation

Ensure that the area is in the open or that it is adequately ventilated before breaking into the system or conducting any hot work. A degree of ventilation shall continue during the period that the work is carried out. The ventilation should safely disperse any released refrigerant and preferably expel it externally into the atmosphere. If

TRANE

#### A2L Information and Installation Requirements

present, check that the ventilation system, including outlets, are operating adequately and are not obstructed.

#### **Refrigerating Equipment**

Refrigerant piping or components should not be installed in locations where substances which may corrode them are present.

Check that equipment hazard markings are visible and legible. Replace them if they are not.

For equipment using secondary fluids, like water or glycol, check that refrigerant is not present in the secondary fluid loop before conducting any hot work.

#### **Electrical Devices**

Do not apply power to the circuit if a fault exists which compromises safety. If the fault cannot be corrected immediately, but it is necessary to continue operation, an adequate temporary solution shall be used. This shall be reported to the owner of the equipment, so all parties are advised.

Initial safety checks shall include:

- Cabling is not subject to wear, corrosion, excessive pressure, vibration, sharp edges, or any other adverse environmental effects. Account for the effects of aging or continual vibration from sources such as compressors or fans.
- Capacitors are discharged. This shall be done in a safe manner to avoid possibility of sparking.
- No live electrical components and wiring are exposed while charging, recovering, or purging the system.
- · Verify continuity of earth bonding.
- Replace electrical components with Trane replacement parts, or those meeting the same ratings and qualified for flame arrest protection, UL LZGH2 category.

## **Leak Detection**

Never use an open flame to detect leaks. A halide torch should not be used. Use only approved leak detection methods per this instruction manual.

The following leak detection methods are deemed acceptable for all refrigerant systems.

Electronic leak detectors may be used to detect refrigerant leaks but, in the case of flammable refrigerants, the sensitivity may not be adequate, or may need recalibration. (Detection equipment shall be calibrated in a refrigerant-free area.) Verify the detector is not a potential source of ignition and is suitable for the refrigerant used. Leak detection equipment shall be set at a percentage of the LFL gas (25% maximum) is confirmed.

Leak detection fluids are also suitable for use with most refrigerants but the use of detergents containing chlorine shall be avoided as the chlorine may react with the refrigerant and corrode the copper pipe-work.

Examples of leak detection fluids are:

· Bubble method

Fluorescent method agents

If a leak is suspected, all naked flames shall be removed/ extinguished.

If a refrigerant leak is found which requires brazing, all refrigerant shall be recovered from the system, or isolated (by means of shut-off valves) in a part of the system remote from the leak.

#### **Refrigerant Removal and Evacuation**

Ensure that the correct number of cylinders for holding the total system charge is available. All cylinders to be used are designated for the recovered refrigerant and labeled for that refrigerant (special cylinders for the recovery of refrigerant, for example). Cylinders shall be complete with pressure-relief valve and associated shut-off valves in good working order. Empty recovery cylinders are evacuated and, if possible, cooled before recovery occurs.

When breaking into the refrigerant circuit to make repairs – or for any other purpose – conventional procedures shall be used. However, for flammable refrigerants it is important that best practice be followed, since flammability is a consideration.

The following procedure shall be adhered to:

- 1. Safely remove refrigerant following local and national regulations.
- 2. Evacuate.
- 3. Purge the circuit with inert gas.
- 4. Evacuate (optional for A2L).
- 5. Continuously flush or purge with inert gas when using flame to open circuit.
- 6. Open the circuit.

Prior to refrigerant removal, open all appropriate valves, including solenoid and electronic expansion valves (EXVs). Use control settings, where available. When not available, manually open all electronically controlled valves using acceptable service procedures.

The recovery equipment shall be in good working order with instructions available. Equipment shall be suitable for the recovery of the flammable refrigerant. For specific handling concerns, contact the manufacturer. Ensure all hose connections are checked for tightness to avoid refrigerant leaks.

In addition, a set of calibrated weighing scales shall be available and in good working order.

The refrigerant shall be recovered into the correct recovery cylinders if venting is not allowed by local and national codes. Do not mix refrigerants in recovery unit and especially not in cylinders.

Refrigerant recovery unit should be purged with an inert gas after each use or before using with a different refrigerant Class – for example, A2L to A1.

If compressors or compressor oils are to be removed, ensure that they have been evacuated to an acceptable level to make certain that flammable refrigerant does not remain within the lubricant. The compressor body shall not be heated by an open flame or other ignition sources to accelerate this process. When oil is drained from a system, it shall be carried out safely.

The system shall be purged with oxygen-free nitrogen to render the appliance safe for flammable refrigerants. This process might need to be repeated several times. Compressed air or oxygen shall not be used for purging refrigerant systems.

The system shall be vented down to atmospheric pressure to enable work to take place.

The outlet for the vacuum pump shall not be close to any potential ignition sources, and ventilation shall be available.

## **Refrigerant Charging**

In addition to conventional charging procedures, the following requirements shall be followed.

- Ensure that contamination of different refrigerants does not occur when using charging equipment.
- Hoses or lines shall be as short as possible to minimize the amount of refrigerant contained in them.
- Cylinders shall be kept in an appropriate position according to the instructions.
- Ensure that the refrigerating system is earthed prior to charging the system with refrigerant.
- Label the system when charging is complete (if not already).
- Extreme care shall be taken not to overfill the refrigerating system.

Prior to recharging the system, it shall be pressure-tested with the appropriate purging gas. The system shall be leaktested on completion of charging but prior to commissioning. A follow up leak test shall be carried out prior to leaving the site.

Prior to refrigerant charging, open all appropriate valves, including solenoid and electronic expansion valves (EXVs). Use control settings, where available. When not available, manually open all electronically controlled valves using acceptable service procedures.

Verify the equipment refrigerant charge is in accordance with the room area limitation as described in Minimum Room Area Limits section.

## Decommissioning

Before carrying out the decommissioning procedure, it is essential that the trained service personnel is completely familiar with the equipment and all its details. It is recommended good practice that all refrigerants are recovered safely. Prior to the task being carried out, an oil and refrigerant sample shall be taken in case analysis is required prior to re-use of recovered refrigerant. It is essential that electrical power is available before the task is commenced.

1. Become familiar with the equipment and its operation.

- 2. Isolate system electrically.
- 3. Before attempting the procedure, ensure that:
  - a. Mechanical handling equipment is available, if required, for handling refrigerant cylinders.
  - b. All personal protective equipment is available and being used correctly.
  - c. The recovery process is supervised at all times by a competent person.
  - d. Recovery equipment and cylinders conform to the appropriate standards.
- 4. Pump down refrigerant system, if possible.
- If a vacuum is not possible, make a manifold so that refrigerant can be removed from various parts of the system.
- 6. Make sure that cylinder is situated on the scales before recovery takes place.
- 7. Start the recovery machine and operate in accordance with instructions.
- 8. Do not overfill cylinders (no more than 80% volume liquid charge).
- 9. Do not exceed the maximum working pressure of the cylinder, even temporarily.
- 10. When the cylinders have been filled correctly and the process completed, make sure that the cylinders and the equipment are removed from site promptly and all isolation valves on the equipment are closed off.
- 11. Recovered refrigerant shall not be charged into another refrigerating system unless it has been cleaned and checked.
- 12. When equipment has been decommissioned, attach a signed and dated label stating it has been decommissioned and emptied of refrigerant.
- 13. Ensure that there are labels on the equipment stating it contains flammable refrigerant.

## A2L Application Considerations

This product is listed to UL standard 60335-2-40, Household and Similar Electrical Appliances – Safety – Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers, which defines safe design and use strategies for equipment using A2L refrigerants. This standard limits the refrigerant concentration in a space in the event of a refrigerant leak. To meet the requirements, the UL standard defines minimum room area, refrigerant charge limit, minimum circulation airflow and/or ventilation airflow requirements, and limits the use of ignition sources in spaces. The standard may require a unit refrigerant leak detection system.

For equipment with R-454B and charge amounts less than or equal to 3.91 lbs per circuit, this UL standard does not prescribe a room area limit and does not require a refrigerant leak detection system or any circulation airflow

A2L Information and Installation Requirements

TRANE

or ventilation airflow mitigation strategies. However, ignition sources in ductwork must be evaluated.

Depending on the application, a specific requirement of ANSI/ASHRAE Standard 15, Safety Standard for Refrigeration Systems, could be more stringent than UL 60335-2-40 requirements. See *Refrigeration Systems and Machinery Rooms Application Considerations for Compliance with ASHRAE*® *Standard 15-2022 Application Engineering Manual* (APP-APM001\*-EN) for more information.

## **Ignition Sources in Ductwork**

Do not install open flames in the ductwork. Hot surfaces exceeding 700°C (1290°F) should not be installed in the ductwork unless the average airflow velocity is not less than 1.0 m\s (200 ft\min) across the heater and proof of airflow is verified before system is energized.

Electric heaters can exceed the surface temperature limit if airflow distribution is poor, or insufficient airflow is provided over the heater.

Surface temperatures of most gas heaters do not exceed the surface temperature limits due to ANSI construction requirements.

## **Ignition Sources in Unit**

This unit does not contain any ignition sources. All potential ignition sources, (including factory or field installed

Table 39.Minimum room area — vertical

accessory electric heaters, gas heaters, relays, and contactors) were evaluated during product UL listing.

#### Minimum Room Area Limits (Refrigerant charge greater than 3.91 lb per circuit)

Equipment with R–454B charge amounts greater than 3.91 lb per circuit may require additional circulation or ventilation airflow mitigation strategies. In this case, two minimum room area ( $A_{min}$ ) thresholds:

- The first threshold defines when equipment serving a single room is required to provide circulation airflow, either continuous or activated by a leak detection system. A ducted system requires circulation airflow unless the smallest room it serves is larger than the adjusted A<sub>min</sub> threshold. This product contains a leak detection system if a circuit charge is greater than 3.91 lbs. As a result, no further leak detection system evaluation is required.
- The second threshold defines when additional ventilation airflow is required. If the room area, A or TA, is below the adjusted A<sub>min</sub> or TA<sub>min</sub> threshold, additional ventilation is required to remove refrigerant in the event of a leak. See the UL 60335-2-40 Clause GG.8 and ANSI\ASHRAE Standard 15 Section 7 for natural and mechanical ventilation requirements.

Models	Minimum Room Area (m <sup>2</sup> ) 0.6 meters height	Minimum Room Area (ft <sup>2</sup> ) 1.9 feet height
GEVK006	8.8	94.5
GEVK009	9.1	97.9
GEVK012	9.3	99.7
GEVK015	11.2	120.3
GEVK018	11.5	123.7
GEVK024	13.2	142.6
GEVK030	13.4	144.3
GEVK036	16.0	171.8
GEVK042	17.6	189.0
GEVK048	19.3	207.9
GEVK060	22.3	240.5
GEVK072	17.0	183.1
GEVK090	23.9	257.3
GEVK120	25.3	272.2
GEVK150	35.7	384.3
GEVK180	37.3	401.9
GEVK240	80.2	863.2
GEVK300	73.6	792.3

Models	Minimum Room Area (m <sup>2</sup> ) 2.2 meters height	Minimum Room Area (ft <sup>2</sup> ) 7.2 feet height
GEHK006	2.4	25.8
GEHK009	2.5	26.7
GEHK012	2.5	27.2
GEHK015	3.0	32.8
GEHK018	3.1	33.7
GEHK024	3.6	38.9
GEHK030	3.7	39.4
GEHK036	4.4	46.9

GEHK048	5.3	56.7
GEHK060	6.1	65.6
GEHK072	4.4	47.5
GEHK090	5.1	54.9
GEHK120	6.7	72.6
GEHK150	10.8	115.9
GEHK180	10.0	108.1

#### Table 40. Minimum room area — horizontal

#### Minimum Room Area (Amin) Adjustments

Use equation below to adjust the minimum room area, as applicable, based on the unit's installation height, altitude, and occupancy level it serves.

Multiply the altitude adjustment factor in the table below by A<sub>min</sub> listed on the unit nameplate or in the Installation, Operation, and Maintenance (IOM) manual.

A<sub>min.adj</sub> = Nameplate A<sub>min</sub> x Altitude Adj x Height Adj x F<sub>occ</sub>

Altitude (ft)	Sea Level to 2000	2001 to 4000	4001 to 6000	6001 to 8000	8001 to 10000	10001 to 12000	12001 to 14000	14001 to 15000	Over 15000
A <sub>min</sub> Adjustment	1	1.05	1.11	1.17	1.24	1.32	1.41	1.51	1.57

In addition,  $A_{min}$  can be adjusted if the unit is installed in a room at a height that is higher than the minimum height shown on the unit. To adjust  $A_{min}$ , multiply by the ratio of the unit minimum release height (in meters) / actual release height (in meters). Use 0.6 m in the ratio for unit minimum installation heights less than or equal to 0.6 m.

For institutional occupancies, ASHRAE Standard 15 applies an additional adjustment factor  $F_{\text{OCC}}$  to the amount of a charge allowed in a space. To calculate the adjusted  $A_{\text{min}}$  for institutional occupancies, multiply the  $A_{\text{min}}$  on the nameplate by two.

# EXAMPLE 1: 20 Ton Packaged Rooftop Multi-Zone VAV System Serving an Institutional Occupancy Space

The packaged unit serves 7600 ft.<sup>2</sup> of a nursing home located at an attitude of 4000 ft. The unit has two equally charged 10 ton refrigeration circuits. Each circuit has 12 lbs

of refrigerant with a minimum room area requirement of 180 ft.<sup>2</sup> with a 2.2 m release height.

#### $TA_{min.adj}$ = 180 ft.<sup>2</sup> x 1.05 x 2 = 378 ft.<sup>2</sup>

No additional ventilation is required.

## EXAMPLE 2: 10 Ton Split System Serving a Single Commercial Occupancy Space

The split system serves a 1500 ft.<sup>2</sup> manufacturing space at 5000 ft. altitude. The final installed charge of the single circuit 10 ton unit is 20 lb. The unit has an open return with a release height of 1 m and ducted supply air. The unit  $A_{min}$  is 660 ft.<sup>2</sup>.

#### A<sub>min.adj</sub> = 660 ft.<sup>2</sup> x 1.11 = 733 ft.<sup>2</sup>

No additional ventilation is required.

#### **A2L Information and Installation Requirements**

#### Determining Room Area (A or TA)

The room area (A) is the room area enclosed by the projection to the floor of the walls, partitions, and doors of the space that the equipment serves. For ducted systems, total room area (TA) of all rooms connected by ducts, may be used instead of A.

Rooms connected by drop ceilings only are not considered a single room.

Rooms on the same floor of the building, and connected by an open passageway, can be considered part of the same room if the passageway is a permanent opening, extends to the floor and is intended for people to walk through.

Adjacent rooms on the same floor of the building and connected by permanent openings in the walls and/or doors between rooms (including gaps between the wall and the floor), can be considered part of the same room if the openings meet the following criteria.

- The opening is permanent and cannot be closed.
- Openings extending to the floor, such as door gaps, need to be at least 20 mm above the floor covering surface.
- Natural ventilations opening areas must meet the requirements of ANSI\ASHRAE Standard 15-2022, Section 7.2.3.2.

Rooms that are connected by a mechanical ventilation system can be considered a single room area if the mechanical ventilation system meets the requirements of ANSI\ASHRAE Standard 15-2022, Section 7.6.4.

## Leak Detection System (Refrigerant charge greater than 3.91 lb per circuit)

The leak detection system consists of one or more refrigerant detection sensors. When the system detects a leak, the following mitigation actions will be initiated until refrigerant has not been detected for at least 5 minutes:

- Energize the supply fan(s) to deliver a required minimum amount of circulation airflow.
- · Disable compressor operation.
- Provide an output signal that can be used to fully open zone dampers and/or VAV boxes and disable electric heat in VAV boxes.
- Provide an output signal that can be used to energize additional mechanical ventilation (if needed).
- Units without airflow proving will disable electric heat sources.

Building fire and smoke systems may override this function.

If the refrigerant sensor has a fault, is at the end of its life, or is disconnected, the unit will initiate the mitigation actions. Mitigation actions may be verified by disconnecting the sensor. The refrigerant sensors do not need service. Use only manufacturer-approved sensors when replacement is required.

## Installation

## A WARNING

# Proper Field Wiring and Grounding Required!

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

Important: If the unit is not equipped with an optional factory installed non-fused disconnect switch, a field supplied disconnect switch must be installed at or near the unit in accordance with National Electrical Code (NEC latest version).

## **General Installation Checks**

The checklist below is a summary of the steps required to successfully install a commercial unit. This checklist is intended to acquaint the installing personnel with what is required in the installation process. It does not replace the detailed instructions that are in the applicable sections of this manual.

1. Remove packaging and inspect the unit. Check the unit for shipping damage and material shortage; file a freight claim and notify appropriate sales representation.

The GEH/V 0.5 to 5 ton and GEVK 6 to 25 ton units have been anchored to the skid with (4) angle brackets. Remove these brackets before lifting unit into place.

The GEH 6 to 15 ton units are anchored to the cross brace of the skid with (4) wood screws. Remove these screws prior to lifting the unit into place.

- 2. Verify the correct model, options and voltage from the unit nameplate.
- 3. Pull out all field attached parts (i.e. filter rack, duct collar, filter and mounting screws) from the unit packaging for field mounting.
- 4. Verify the installation location of the unit provides the required clearance for proper operation.
- 5. Remove refrigeration access panel and inspect the unit. Be certain the refrigerant tubing has clearance from adjacent parts.
- 6. Fabricate and install duct work
- 7. Install and connect a condensate drain line and trap to the drain connection.

## Main Electrical

## A WARNING

## Hazardous Voltage!

Failure to disconnect power before servicing could result in death or serious injury.

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/ tagout procedures to ensure the power can not be inadvertently energized. Verify that no power is present with a voltmeter.

- 1. Verify the power supply complies with the unit nameplate specifications.
- 2. Inspect all control panel components; tighten any loose connections.
- Connect properly sized and protected power supply wiring to a field-supplied/installed disconnect switch and to the main compressor contactor/power block 1K1 (compressor contactor on the 0.5 to 5 ton) for GEH/V 0.5 to 5 ton or 1TB1 for GEH/V 6 to 25 ton equipment in the unit control panel.
- 4. Install proper grounding wires to an earth ground.
- **Note:** All field-installed wiring must comply with NEC and applicable local codes.

## **Electric Heat Requirements**

- 1. Verify that the power supply complies with the electric heater specifications on the unit and heater nameplate.
- 2. Inspect the heater junction box and control panel; tighten any loose connections.
- 3. Check electric heat circuits for continuity.
- See Electric Heat and 575V Water Source Heat Pump Installation Instructions 0.5 to 6 Tons (WSHP-SVN011\*-EN) for more information.

## Low Voltage Wiring (AC) Requirements

- 1. Install the zone sensor or thermostat.
- 2. Connect properly sized control wiring to the proper termination points between the zone thermostat or sensor and the unit control panel.

## **Filter Installation**

Each unit ships with 1-inch (25.4 mm) standard, 2-inch (50.8 mm) standard, 2-inch MERV 8 or 2-inch MERV 13 filter. The quantity of filters is determined by unit size. The GEH 0.5 to 5 ton units require field installation of the 1-inch or 2-inch filters rack. All sheet metal bracket, filter and hardware are in a box located on the side of the unit within the unit packaging. All vertical and GEH 6 to 15 ton

horizontal units ship with the filter rack and filters factory installed.

Note: Do not operate the unit without filters.

## **Supply-Air Ductwork**

Horizontal 0.5 to 5 ton units require duct flanges to be field installed. The duct flange ships in a box on the side of the unit. Install the flange with (8) 3/8-inch (213 mm) factory supplied screws.

Install the 1-inch (25.4 mm) supply-air duct flange to the vertical and horizontal equipment with the (8) 5/16-inch (7.94 mm) factory-supplied head screws. The duct collar assembly for each unit is shipped with the unit in the same box where the IOM manual is located.

When attaching the field ductwork to the unit, provide a watertight flexible connector at the unit to prevent operating sounds from transmitting through the ductwork (See the figure below).

Elbows with turning vanes or splitters are recommended to minimize air noise due to turbulence and to reduce static pressure.

## **Return-Air Ductwork**

Install the 1/2-inch (25.4 mm/50.8 mm) adjustable filter rack to the horizontal equipment only with the use of (4) 5/16-inch (7.94 mm) factory supplied head screws. The vertical equipment factory ships with the filter rack and filter(s) installed.

When attaching the field ductwork to the unit, provide a watertight flexible connector at the unit to prevent operating sounds from transmitting through the ductwork.

Elbows with turning vanes or splitters are recommended to minimize air noise due to turbulence and to reduce static pressure.

## **Ducted Panel**

The return-air arrangement may be easily converted from a free return-air system, to a ducted return-air system with the addition of a return-air side panel. By replacing the filter racks with the return-air panel, a complete seal from the duct to the unit is possible. The 1-inch duct flange facilitates ease of field connection to the duct system. This accessory is typically used when the return-air filter is placed in a built-in ceiling grille, or placed within a field provided filter rack assembly.

Install the return-air duct panel to the return-air opening with the six screws provided for the filter rack assembly.

#### Table 43. Ducted filter opening size - 0.5 to 5 tons (continued)

Note: All dimensions in inches. All dimensions are for accessory 2 or 4-inch filter rack.

## **Sound Attenuation Pad**

For sound-sensitive installations, a vibration pad (field provided) should be placed beneath the horizontal or vertical equipment. For the horizontal unit, the pad should be approximately twice the size of the unit foot print. For the vertical unit, the pad should be 0.5-inch (12.7 mm) thick and equal to the overall unit foot print.

## Hanging the Horizontal Unit

## A WARNING

**Proper Structural Support Required!** 

Failure to ensure proper structural ceiling support could result in unit falling from its location which could result in death or serious injury. Ceiling structure must be strong enough to support

the weight of the unit and any accessories. If unsure, check with a structural engineer.

To hang the horizontal configuration (see the figure below):

- For 0.5 to 5 tons models, install the hanging isolators (located in the control box from factory) into the six hanging brackets.
- 2. Use a lift with a large supporting surface or a wooden structure supporting the base of the unit (hanging rails) when the unit is lifted for installation.
- Secure the equipment to a joist, concrete, etc. with the use of 3/8-inch (9.7 mm) field provided (all-thread) rod. Each rod should contain field provided nuts and washers to complete the hanging installation.
- 4. Slope 6 to 25 ton horizontal units in two directions. The unit should contain a dual 0.25- 12 pitch toward the drain connection. This confirms proper drainage of the unit. All plumbing to the unit should conform per national and local codes and is the responsibility of the contractor. The 0.5 to 5 ton horizontal models do not need to be sloped and must be installed level.
- **Note:** Rods must be perpendicular to the mounting holes in the base rail of the horizontal unit.

Figure 49. Hanging the unit (0.5 to 5 Tons)

## **Condensate Drain Connection**

Figure 50. Negative pressure system

- For all GEV 0.5 to 25 ton and GEH 0.5 to 5 ton models, the drain connection is 0.75-inch NPT.
- For 6 to 15 ton GEH models, the drain connection is 0.5-inch PVC schedule 40 pipe.

Install proper trapping to the equipment.

When designing the condensate trap for the water-source system, it is important to consider the unit draw-through design requiring negative pressure trapping.

In a properly trapped system, when condensate forms during normal operation, the water level in the trap rises until there is a constant flow. It is imperative to maintain water in the trap and not allow the trap to dry out during heating season. Keeping trap primed at all times will

enable the water to flow properly. See the figure above for appropriate dimensions required in a negative pressure system.

## **Supply Pipe Connections**

#### Figure 51. Supply/return pipe connections

Connect the supply and return hoses to the water-inlet (from supply) and water-outlet (to return) of the unit. For vibration isolation, it is recommended that flexible steelbraided hoses be installed instead of hard piping the equipment to the main loop system. Figure above shows connection of a Hays Mesurflo® balancing hose kit to the water-in and water-out of a vertical unit.

**Note:** Above figure example incorporates the Hays Mesurflo® balancing hose kit and a 2-position isolation valve into the system design. An isolation valve is often used in variable speed pumping applications and is designed to stop water flow to the unit during non operation times. This allows the loop water pumps to run only when a requirement for pumping is needed for greater energy efficiency of the overall system design.

# Cleaning and Flushing the Water Loop

After the piping system is complete, the flexible hose connectors should be doubled back to complete the water circuit external to the unit (avoiding trash settle-out in the condenser). An extra pipe may be necessary to connect the hose kits.

- 1. Water circulation system should be filled with clean water using the water make up connections.
- Note: Air vents should be open during filling.
- 2. With the air vents closed, start the circulating pump and then crack the air vents to bleed off the trapped air to confirm circulation through all components of the system.
- **Note:** Make up water must be available to the system to replace the volume formerly occupied by the air that is bled off.

- With the air vented and the water circulating, the entire system should be checked for leaks and repaired as required.
- 4. Operate the supplementary heat system (boiler) making checks per manufacturer's instructions. During this operation, visual checks should be made for leaks that may have occurred due to increased heat. Repair as required.
- 5. Open the system at the lowest point for the initial blow down (making sure the make up water is equal to the water being dumped). Continue blow down until the water leaving the drain runs clear, but not less than 2 hours.
- 6. Shutdown pumps and supplementary heat system. Reconnect the hoses placing the water-to-refrigerant heat exchanger in the water circulating system.
- **Note:** Vents should be open when the pumps and supplementary heat system are shutdown.

## **Field Installed Power Wiring**

## **WARNING**

# Proper Field Wiring and Grounding Required!

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

## NOTICE

#### **Use Copper Conductors Only!**

Failure to use copper conductors could result in equipment damage as the equipment was not designed or qualified to accept other types of conductors.

Verify that the power supply available is compatible with the unit's nameplate. Use only copper conductors to connect the power supply to the unit.

Units rated for dual voltage applications (208V/230V) are shipped with default voltage of 230V from factory. To convert to 208V, the primary lead on the transformer must be removed and switched to the 208V tap.

## **Main Unit Power Wiring**

## 

#### Proper Field Wiring and Grounding Required!

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

A field supplied disconnect switch must be installed at or near the unit in accordance with the National Electric Code (NEC latest edition).

Location of the applicable electric service entrance for HIGH (line voltage) may be found in the Dimensions section of this manual.

The high-voltage connection is made at the 1K1 contactor or 1TB power block inside the unit control box (See the figure below). See the customer connection diagram that is shipped with the unit for specific termination points.

Provide proper grounding for the unit in accordance with the local and national codes.

CONTACTOR

Figure 52. Power wiring example

## **Control Power Transformer**

CONTACTOR

The 24 V control power transformers are to be used only with the accessories called out in this manual. A 50 VA

transformer is externally fused. Transformers rated greater than 50 VA are equipped with circuit breakers. If a circuit breaker trips, turn OFF all power to the unit before attempting to reset it.

## A WARNING

#### Hazardous Voltage!

Failure to disconnect power before servicing could result in death or serious injury.

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/ tagout procedures to ensure the power can not be inadvertently energized. Verify that no power is present with a voltmeter.

The transformer is located in the control panel.

## **Thermostat Location**

Location of the thermostat or zone sensor is an important element of effective room control.

Areas where the thermostat or zone sensor should not be located include:

- Behind doors or corners
- Near hot or cold air ducts
- Near radiant heat (heat emitted from appliances or the sun)
- · Near concealed pipes or chimneys
- · On outside walls or other non conditioned surfaces
- · In airflows from adjacent zones or other units

## **Thermostats and Zone Sensors**

## **Controls Using 24 Vac**

Before installing any wire, see the electrical access locations in the Unit Dimensions and Weights sections of this manual.

The AC control wiring between the controls and the unit termination point must not exceed 3 Ohms/conductor for the length of the run.

## NOTICE

#### **Component Failure!**

Resistance in excess of 3 ohms per conductor could result in component failure due to insufficient AC voltage supply.

Do not exceed three (3) ohms per conductor for the length of the run.

Check all loads and conductors for grounds, shorts, and mis-wiring. Use copper conductors unless otherwise specified. Do not run the AC low-voltage wiring in the same conduit with the high voltage power wiring.

#### Table 47. 24V AC conductors

Distance from unit to control	Recommended wire size
000-460 ft.	18 gauge
461-732 ft.	16 gauge
733-1000 ft.	14 gauge

Low-voltage connection diagrams for deluxe 24 V control packages for these thermostats mounted on 6 to 25 ton equipment sizes are shown in the figures below.

## Figure 54. Low-voltage connection (GEH/V 6 to 25 ton)

Figure 55. Low voltage wire connection (GEH/V 0.5 to 5 ton)

Figure 56. Low voltage single wire connection (GEH/ V 0.5 to 5 ton)

Make connection for a single-wire by inserting a single wire after stripping off the coating.

# Figure 57. Low voltage stranded wire connection (GEH/V 0.5 to 5 ton)

Follow the steps to connect the stranded wire:

- 1. Release the spring with a dedicated screwdriver (blade width 2.5 mm)
- 2. Insert the stripped cable as far as it gets inserted.
- 3. Complete the connection by removing the screwdriver.

## A WARNING

#### Hazardous Voltage!

Failure to disconnect power before servicing could result in death or serious injury.

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/ tagout procedures to ensure the power can not be inadvertently energized. Verify that no power is present with a voltmeter.

## A WARNING

# Proper Field Wiring and Grounding Required!

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

# External Smoke Detection Wiring to Unit

## **Deluxe Controller**

To inhibit operation of the compressor and fan for a safety shutdown, it is necessary to break the wire (21X) from the 24 Volt transformer to the 1TB1 terminal block. This can be done with the dry contacts of a relay. When that connection is opened, it terminates voltage to both the deluxe controller and the thermostat, which stops/prevents all control function to the fan and compressor.

## Symbio<sup>™</sup> 400-B/500 Controller

To inhibit operation of the compressor and fan for a safety shutdown, it is necessary to break the wire (21A) from the 24 Volt transformer to the Symbio 400-B/500 (1U1). This can be done with the dry contacts of a relay. When that connection is opened, it terminates the power voltage to the controller, which stops/prevents all control function including the fan and compressor.

## **Airflow Adjustment**

## A WARNING

#### **Rotating Components!**

Failure to disconnect power before servicing could result in rotating components cutting and slashing technician which could result in death or serious injury.

During installation, testing, servicing and troubleshooting of this product it may be necessary to work with live and exposed rotating components. Have a qualified or licensed service individual who has been properly trained in handling exposed rotating components, perform these tasks.

#### Note: GEH/V 6 to 25 ton units only.

- To increase cfm, loosen the turns open set screw on the sheave, and turn the sheave clockwise.
- To decrease cfm, loosen the turns open set screw on the sheave, and turn the sheave counterclockwise.
- To increase belt tension, loosen the adjustment bolt and pull motor mounting plate back until the belt is tight. Tighten the adjustment bolt after the belt has reached the desired tension.

See the figure below for fan motor and sheave adjustment.

#### Figure 64. Fan motor and sheave adjustment

- 1. Belt
- 2. Adjustment Bolt and
- Plate 3. Sheave
- . Sheave

## GEV/H 0.5 to 5 tons - Units with Deluxe 24V controls

For sizes 006-060, the ECM is programmed for constant torque and delivers airflow similar to a PSC motor while operating at a higher efficiency.

### Figure 65. ECM control box

Figure 66. ECM control board

- 1. Potentiometer will be used to adjust the PWM output
- 2. Seven segment display

Using a screwdriver, the potentiometer is used to adjust the PWM output from 20% to 100% PWM. Increasing the PWM increases the motor speed. When setting the airflow for air balancing, the high-speed terminal (GH) must have 24 Vac signal. This confirms the PWM output is adjusted for the full load airflow.

The display shows the commanded motor speed percentage. If running on low speed (GL), the low-speed value is displayed. If running in GH the high-speed value is displayed. If both GH and GL input signals are present, the PWM output value is the GH value.

Note: ECM control board is only on units with Deluxe 24V controls. Tracer® TU is used to adjust fan speed on units with Symbio™ 400-B controls.

# Waterside Economizer Installation

## A WARNING

### Hazardous Voltage!

Failure to disconnect power before servicing could result in death or serious injury.

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/ tagout procedures to ensure the power can not be inadvertently energized. Verify that no power is present with a voltmeter.

## A WARNING

## Proper Field Wiring and Grounding Required!

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

# Waterside Economizer Installation for Horizontal 0.5 to 5 Ton Units

The following steps were sequenced to aid in the installation and pairing of a water side economizer to a 0.5 to 5 ton horizontal water source heat pump.

1. Remove the filter bracket from the unit. It is secured by four screws: three on top (circled) and two on the bottom (not shown). Do not discard the filter brackets.

### Figure 67. Step 1

2. Mount the waterside economizer to the unit. It is secured to the unit using the three engagement holes used for the filter bracket on the top. Secure the sides of the economizer using the two L-Brackets on each side by lining up the engagement holes for the

### Figure 68. Step 2

- 3. Attach the filter bracket to the waterside economizer using the five screws removed earlier. Install the air filter.
- Install the braided hose connecting point A (leaving the WSE) to point B (entering the WSHP). Connect the supply water to point D and the return water to point C.

### Figure 69. Step 4

- 5. Locate the entering water sensor that is located behind the unit's control box, and wire tie it to the water SUPPLY side of the piping. The sensor must be mounted before the two-position valve. Attaching the sensor anywhere else will cause the WSE to not operate correctly. Bundle up any excess sensor wire and wire tie the bundle neatly.
- Locate the WSE valve wires (35B (COM), 36B (OPEN), 37B (CLOSE)) behind control box, and connect to the valve actuator. Bundle up any excess wire and wire tie the bundle neatly. Direction of rotation is reversible with switch.
- 7. Insulate the economizing piping package and the associated hoses via field pipe insulation. Insulating the

piping will prevent condensation from forming on the pipe and dripping on the floor.

Notes:

- Trane does not provide insulation on the economizing piping package. The insulation must be field provided and field installed.
- Trane does not provide condensate overflow protection of the waterside economizer. This must be field provided and installed.
- Field pipe the drain lines of the waterside economizer and water-source heat pump. Both the WSE and unit condensate drains must be separately trapped for proper handling of condensation (see Figure 70, p. 74). Both Vertical and Horizontal units will be piped similar to each other. The drain connection is located on the bottom side of the economizing coil.

#### Figure 70. Step 8

Note: Condensate line slope must be 1/4-inch for every 12inches of run.

### **Negative Pressure Trapping**

- H = 1-inch (25.4 mm) for every 1-inch (25.4 mm) of maximum negative static pressure +1-inch (25.4 mm)
- J = Half of H
- L = H + J + Pipe Diameter + Insulation

#### Table 48. Economizer part numbers

# Waterside Economizer Installation for Vertical 0.5 to 5 Ton Units

The following steps were sequenced to aid in the installation and pairing of a water side economizer to a 0.5 to 5 ton vertical water source heat pump.

1. Remove the filter bracket from the unit. It is secured by five screws: three on top (circled) and two on the bottom (not shown). Do not discard the filter brackets.

Figure 71. Step 1

2. Mount the waterside economizer to the unit. It is secured to the unit using the five engagement holes that were used for the filter brackets: three on top and two on the bottom.

### Figure 72. Step 2

3. Attach the filter brackets to the waterside economizer using five screws. Install the air filter.

#### Figure 73. Step 3

4. Install the braided hose connecting point A (leaving the WSE) to point B (entering the WSHP). Connect the supply water to point D and the return water to point C.

#### Figure 74. Step 4

- 5. Locate the entering water sensor that is located inside the unit's control box, and wire tie it to the water SUPPLY side of the piping. The sensor must be mounted before the two-position valve. Attaching the sensor anywhere else will cause the WSE to not operate correctly. Bundle up any excess sensor wire and wire tie the bundle neatly.
- Locate the WSE valve wires (35B (COM), 36B (OPEN), 37B (CLOSE)) behind control box, and connect to the valve actuator. Bundle up any excess wire and wire tie the bundle neatly. Direction of rotation is reversible with switch.
- Insulate the economizing piping package and the associated hoses via field pipe insulation. Insulating the piping will prevent condensation from forming on the pipe and dripping on the floor.

#### Notes:

- Trane does not provide insulation on the economizing piping package. This insulation must be field provided and field installed.
- Trane does not provide condensate overflow protection of the waterside economizer. This must be field provided and installed.
- 8. Field pipe the drain lines of the waterside economizer and water-source heat pump together prior to installing a condensate trap for proper trapping of condensation (see Figure 70, p. 74). The vertical units will be piped similar to the horizontal units. 0.88 ID flex hose with appropriate flammability rating would be needed to connect to the drain pan stub out on the water side economizer drain pan.

	GEVK036-042	WSHPECN00011
	GEVK048-060	WSHPECN00012

#### Table 49. Economizer part numbers

# Waterside Economizer Installation for GEH and GEV 6 to 25 Ton Models

## 

### Hazardous Voltage!

Failure to disconnect power before servicing could result in death or serious injury.

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/ tagout procedures to ensure the power can not be inadvertently energized. Verify that no power is present with a voltmeter.

## 

# Proper Field Wiring and Grounding Required!

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

- 1. Remove the filter frame from the unit.
- 2. Remove the waterside service panel from the unit.
- 3. Remove the control box service panel from the unit.
- 4. Remove the economizer and miscellaneous mounting parts from it's packaging.
- GEV ONLY: Mount the economizer support angle (4475 1637 0100) found in the economizer packaging in the same holes of the return air filter frame removed in Step 1. The support angle screws into the unit roof.
- 6. GEV ONLY: Hang the economizer assembly from the economizer support angle mounted in Step 5.

- Secure the economizer to the unit using the four plates (4475 1630 0100) found in the economizer packaging. Two plates should be applied to each economizer side. GEV ONLY: Secure the bracket on the bottom of the economizer cabinet to the unit compressor compartment center post.
- 8. Install the field portion of the water piping and the 3way valve together.
- Verify the control board for the waterside economizer is located inside the unit. The temperature rating of this board is factory set to 55°F.
- 10. Thread the economizer's entering water temperature sensor (4RT1) through the water-in line of the water-source heat pump upstream from the valve. This sensor is used by the economizer's 3-way valve to determine if water flow should be directed through the waterside economizing coil.
- 11. Tie wrap the thermistor to the water line (supply side) upstream of the water pipe to the economizer. The thermistor must be situated so that the thermistor is capable of reading the actual entering water temperature regardless of the economizer's on or off situation.
- 12. Insulate the thermistor with tubing insulation.
- Tie wrap each end of the tubing insulation to prevent air filtration. The tie wraps and insulation are located in a bag and shipped inside of the unit.
- 14. Route the factory wire harness through the low voltage hole of the heat pump to the 3-way valve's wire harness.
- 15. Connect the factory installed wire harness to the wire harness supplied with the 3-way valve.
- 16. Bundle excess valve wire, and wire tie the bundle neatly.
- 17. Install control side service panel to the heat pump.
- 18. Install the unit filter frame to the economizing inlet.
- 19. Insulate the economizing piping package with field supplied pipe insulation. Insulating the piping will help stop condensation from forming on the pipe.

#### Notes:

- Trane does not provide insulation on the economizing piping package. This insulation must be field provided and field installed.
- Trane does not provide condensate overflow protection of the waterside economizer. This must be field provided and field installed.
- Trane does not provide freeze protection for the WSE.

20. Install waterside service panel to the heat pump.

The economizer condensate line must be trapped prior to the unit's drain line. This helps prevent air from being sucked through the drain line causing condensate to spit or build-up in the economizer or unit drain pans. Field pipe the drain lines of the waterside economizer and water-source

heat pump together prior to installing a condensate trap. See Condensate Drain Connection for proper trapping of condensation.

# Waterside Economizer Start-Up Sequence

- 1. Set the thermostat to the highest position.
- 2. Set the thermostat system switch to COOL with the fan control to AUTO. The compressor should NOT run.
- 3. Reduce the thermostat setting until the compressor, reversing valve, solenoid valve, and loop pump are energized. Adjust water flow utilizing pressure/ temperature plugs and comparing to tables contained in specification sheet data. Water leaving the heat exchanger should be warmer than the entering water temperature (approximately 9 to 12°F); blower operation should be smooth; compressor and blower amps should be within data plate ratings; the suction line should be cool with no frost observed in the refrigerant circuit.
- 4. Check the cooling refrigerant pressures against values in "Operating Pressures," p. 81.
- **Note:** If cooling mode is activated, and the entering water temperature of the heat pump falls below 55°F, the 2-position, water side economizing valve will become energized (open) and compressor operation will halt allowing for free cooling in the space.
- 5. Turn the thermostat system switch to the OFF position. Unit should stop running and the reversing valve should de-energize.

- 6. Leave unit off for approximately FIVE minutes to allow for pressure equalization.
- 7. Turn the thermostat to the lowest setting.
- 8. Set the thermostat system switch to the HEAT position.
- 9. Adjust the temperature setting upward until the unit is energized. Warm air should blow from the register. A water temperature decrease of approximately 5 to 9°F leaving the heat exchanger should be noted. The blower and compressor operation should be smooth with no frost observed in the refrigeration circuit.
- 10. Check the heating refrigerant pressures against values in "Operating Pressures," p. 81.
- **Note:** For units with boilerless electric heat option: In heating mode, if the entering water temperature of the heat pump falls below 45°F, the electric heater will be energized, and compressor operation will halt. Once the entering water temperature rises above 50°F, the boilerless controls returns the unit.
- 11. Set the thermostat to maintain the desired space temperature.
- 12. Instruct the owner on system operation.

Unit Size (60 Hz)	Unit Size (50 Hz)	Valve Conn. Size	Valve Pres. Rating	Valve Close-off pressure	Valve Temp. Range	Actuator
GEHK 006-015 GEVK 006-012	_	1/2 FPT	600 psi	200 psi	0°F to 250°F -18°C to 121°C	Non-spring return type 24 Vac +/- 20% 135 second stroke time 10 Cv at full port

### Table 50. Waterside economizing three-way valve specifications (GEH/V units)

Table 50.	Waterside economizing	three-way	valve sp	pecifications (	(GEH/V units)	(continued)
	Tratorolao ocorronnizing	, an oo may	14110 00	oomoutiono (		(continuou)

Unit Size (60 Hz)	Unit Size (50 Hz)	Valve Conn. Size	Valve Pres. Rating	Valve Close-off pressure	Valve Temp. Range	Actuator
GEVK 20 and 25 Ton	GEVK 15 and 20 Ton	2 FPT	600 psi	200 psi	0°F to 250°F -18°C to 121°C	Non-spring return type 24 Vac +/- 20% 135 second stroke time 57 Cv at full port

Note: The valve body is constructed from forged brass with nickel plating, with the ball and stem constructed of stainless steel. For other information pertaining to the economizing water valve, see the valve's data plate.

# **Pre-Start Checklist**

Before energizing the unit, the following system devices must be checked:

- Is the high voltage power supply correct and in accordance with the nameplate ratings?
- Is phasing of the unit correct per compressor rotation (scroll compressor only)?
- Is the field wiring and circuit protection the correct size?
- Is the low voltage control circuit wiring correct per the unit wiring diagram?
- Is the piping system clean/complete and correct? (A recommendation of all system flushing of debris from the water-to-refrigerant heat exchanger, along with air purging from the water-to-refrigerant heat exchanger be done in accordance with the Closed-Loop/Ground Source Heat Pump Systems Installation Guide).
- Is vibration isolation provided? (i.e. unit isolation pad, hose kits)
- Is unit serviceable? (See clearance specifications in Unit Dimensions and Weights).
- Are the low/high-side pressure temperature caps secure and in place?
- · Are all the unit access panels secure and in place?
- Is the thermostat in the OFF position?
- Is the water flow established and circulating through all the units?
- Is the duct work correctly sized, run, taped, insulated and weather proofed with proper unit arrangement?
- Is the condensate line properly sized, run, trapped, pitched and primed?
- Is the zone sensor correctly wired and in a good location?
- · Does the indoor blower turn freely without rubbing?
- Has all work been done in accordance with applicable local and national codes?
- Has heat transfer fluid been added in the proper mix to prevent freezing in closed system application?

# Start-Up

# **Initial Unit Start-Up**

**Note:** Start-up with the heat pump thermostat is included below:

- 1. Set the thermostat to the highest position.
- 2. Set the thermostat system switch to COOL with the fan control to AUTO. The compressor should NOT run.
- Reduce the thermostat setting until the compressor, reversing valve, solenoid valve, and loop pump are energized. Adjust water flow utilizing pressure/ temperature plugs and comparing to tables contained in specification sheet data.
- 4. Water leaving the heat exchanger should be warmer than the entering water temperature (approximately 9 to 12°F); blower operation should be smooth; compressor and blower amps should be within data plate ratings; the suction line should be cool with no frost observed in the refrigerant circuit.
- 5. Check the cooling refrigerant pressures against values in "Operating Pressures," p. 81.
- 6. Turn the thermostat system switch to the OFF position. Unit should stop running and the reversing valve should de-energize.
- 7. Leave unit off for approximately 5-minutes to allow for pressure equalization.
- 8. Turn the thermostat to the lowest setting.
- 9. Set the thermostat system switch to the HEAT position.
- 10. Adjust the temperature setting upward until the unit is energized. Warm air should blow from the register. A water temperature decrease of approximately 5 to 9°F leaving the heat exchanger should be noted. The blower and compressor operation should be smooth with no frost observed in the refrigeration circuit.
- 11. Check the heating refrigerant pressures against values in "Operating Pressures," p. 81.
- 12. Set the thermostat to maintain the desired space temperature.
- 13. Instruct the owner on system operation.
- **Note:** For units with a field-installed waterside economizer, see "Waterside Economizer Start-Up Sequence," p. 78.

## Start-Up Checklist and Log

Installing Contractor: Use this checklist to thoroughly check-out the system and units before and during start-up. (This form need not be returned to the factory unless requested during technical service support).

Job Name:	_
Model Number:	_
Date:	_
Serial Number:	—

To minimize troubleshooting and costly system failures, complete the following checks and data entries before the system is put into full operation.

# **Operating Pressures**

There are many variables (airflow, air temperatures) in an air conditioning system that will affect operating refrigerant pressures and temperatures. The charts below shows approximate conditions and is based on air flow at the rated SCFM, entering air at  $80.6^{\circ}F$  (DB),  $66.2^{\circ}F$  (WB) in cooling,  $68^{\circ}F$  (DB) in heating. (+)Heating data with  $35^{\circ}F$  EWT is based on the use of an anti-freeze solution having a freezing point  $20^{\circ}F$  lower than the minimum expected entering temperature.

Table 52.	Operating pressures	in cooling/heating for	GE units (continued)
-----------	---------------------	------------------------	----------------------

## Water Pressure Drop

Use the following tables to define feet of head/pressure drop. Please note the feet of pressure (ft/head) provided is at AHRI/ISO standard.

To calculate feet of head, when using gauges that read in PSIG, multiply PSI by 2.31.

 
 Table 53.
 Cooling water pressure drop (WPD) in feet of head for GE\* units

Unit Size (60 Hz)	Unit Size (50 Hz)	EWT °F	GPM	Ft. Pressure
GEV/H006		86	1.5	1.8

# Water Volume

The information below is provided for use in calculating glycol requirements for the unit.

# Maintenance

## 

### Hazardous Service Procedures!

Failure to follow all precautions in this manual and on the tags, stickers, and labels could result in death or serious injury.

Technicians, in order to protect themselves from potential electrical, mechanical, and chemical hazards, MUST follow precautions in this manual and on the tags, stickers, and labels, as well as the following instructions: Unless specified otherwise, disconnect all electrical power including remote disconnect and discharge all energy storing devices such as capacitors before servicing. Follow proper lockout/tagout procedures to ensure the power can not be inadvertently energized. When necessary to work with live electrical components, have a qualified licensed electrician or other individual who has been trained in handling live electrical components perform these tasks.

These units are intended to only be serviced or manipulated by approved personnel.

## **Preventative Maintenance**

Maintenance on the unit is simplified with the following preventive suggestions:

Filter maintenance must be performed to assure proper operation of the equipment. Filters should be inspected at least every three months, and replaced when it is evident they are dirty. Filter sizing is shown below.

Table 56.	Filter sizing GE* models
-----------	--------------------------

Size (60 Hz)	Size (50 Hz)	Filter Size (Nominal) inches					
	GEH						
006	_	14 x 16					
009	—	14 x 16					
012	—	14 x 16					
015	—	16 x 19					
018	—	16 x 19					
024	—	17 x 20					
030	—	17 x 20					
036	—	18 x 23					
042	—	18 x 23					
048	—	20 x 30					
060	—	20 x 30					
072	_	20 x 25 (3)					
090	072	20 x 25 (3)					
120	090	20 x 25 (3)					

#### Table 56. Filter sizing GE\* models (continued)

Size (60 Hz)	Size (50 Hz)	Filter Size (Nominal) inches
150	120	20 x 25 (3)
180	150	20 x 25 (3)
	GE	V
006	—	14 x 16
009	—	14 x 16
012	—	14 x 16
015	—	16 x 19
018	—	16 x 19
024	_	17 x 20
030	_	17 x 20
036	_	18 x 23
042	_	18 x 23
048	_	20 x 30
060	_	20 x 30
072	—	20 x 20 (4)
090	072	20 x 20 (4)
120	090	20 x 20 (4)
150	120	20 x 25 (6)
180	150	20 x 25 (6)
240	180	20 x 25 (6)
300	240	20 x 25 (6)

Check the contactors and relays within the control panel at least once a year. It is good practice to check the tightness of the various wiring connections within the control panel.

A strainer (60 mesh or greater) must be used on an open loop system to keep debris from entering the unit heat exchanger and to confirm a clean system.

For units on well water, it is important to check the cleanliness of the water-to-refrigerant heat exchanger. Should it become contaminated with dirt and scaling as a result of bad water, the heat exchanger will have to be back flushed and cleaned with a chemical that will remove the scale. This service should be performed by an experienced service person.

## **A** WARNING

## Hazardous Chemicals!

Failure to follow this safety precaution could result in death or serious injury. Coil cleaning agents can be either acidic or highly alkaline and can burn severely if contact with skin or eyes occurs.

Handle chemical carefully and avoid contact with skin. ALWAYS wear Personal Protective Equipment (PPE) including goggles or face shield, chemical resistant gloves, boots, apron or suit as required. For personal safety refer to the cleaning agent manufacturer's Materials Safety Data Sheet and follow all recommended safe handling practices.

It should be noted that the water quality should be checked periodically (See below).

Scaling	Amount
Calcium and magnesium (total hardness)	Less than 350 ppm
Corrosion	_
рН	7-9.5
Hydrogen Sulfide	Less than 1 ppm
Sulfates	Less than 25 ppm
Chlorides	Less than 125 ppm
Carbon Dioxide	Less than 75 ppm
Total dissolved solids (TDS)	Less than 1000 ppm
Biological Growth	_
Iron Bacteria	Low
Erosion	_
Suspended Solids	Low

#### Table 57. Water quality

# **Condensate Trap**

For units incorporating a negative trap design, confirm that the condensate system is primed with water at all times. Allowing a negative pressure condensate system to run dry could cause a break in the condensate seal allowing the fan to draw water from the condensate line to spray moisture into the mechanical system. By maintaining a primed condensate trap, a seal is created that prevents these complications.

# Troubleshooting

## A WARNING

### **Hazardous Service Procedures!**

Failure to follow all precautions in this manual and on the tags, stickers, and labels could result in death or serious injury.

Technicians, in order to protect themselves from potential electrical, mechanical, and chemical hazards, MUST follow precautions in this manual and on the tags, stickers, and labels, as well as the following instructions: Unless specified otherwise, disconnect all electrical power including remote disconnect and discharge all energy storing devices such as capacitors before servicing. Follow proper lockout/tagout procedures to ensure the power can not be inadvertently energized. When necessary to work with live electrical components, have a qualified licensed electrician or other individual who has been trained in handling live electrical components perform these tasks.

# **Deluxe Controls**

Troubleshooting units containing the deluxe control option is easy using the three light emitting diodes (LEDs). These LEDs are provided for indicating the operating mode of the controller and are labeled on the circuit board with numbers as referenced in the table below.

### Table 58. Diagnostic LEDs

Color: Green	Color	: Red	Controller Mode
LED1	LED2	LED3	_
OFF	OFF	OFF	Control OFF
ON	OFF	OFF	Normal/Compressor OFF
ON	OFF	FLASH	Anti-short cycle
ON	OFF	ON	Normal/Compressor ON
FLASH	ON	OFF	Brownout Condition
ON	FLASH	ON	Soft Lockout (low pressure)
ON	FLASH	FLASH	Soft Lockout (high pressure)
ON	ON	ON	Manual Lockout (low pressure)
ON	ON	FLASH	Manual Lockout (high pressure)
ON	FLASH	OFF	Manual Lockout (condensate overflow)
ON	ON	OFF	Compressor Disable

#### Table 59.Troubleshooting table

Problem	Heating	Cooling	Cause	Correction
	х	х	Main power off	Check fuses
	х	х	Defective control transformer	Replace
No response to any thermostat setting	х	х	Broken or loose connection	Repair
	х	х	Defective thermostat	Replace
	х	х	Transformer	Reset Transformer
Unit short cycles	х	х	Thermostat or sensor improperly located	Relocate

### Table 59. Troubleshooting table (continued)

Problem	Heating	Cooling	Cause	Correction
	х	х	Defective compressor overload	Replace (if external)
	х	х	Defective compressor contactor	Replace
Blower runs, but compressor does	х	х	Supply Voltage too low	Correct
not	х	х	Defective compressor capacitor	Replace
	х	х	Defective windings	Replace
	х	х	Limit switches open	Check cause/Replace or repair
	х	х	Dirty filter	Replace/clean
	х	х	Blower RPM too low	Correct
	х	х	Loss of conditioned air due to leaks in ductwork	Repair leaks
		х	Introduction of excessively hot return-air	Correct
	х	—	Introduction of excessively cold return-air	Correct
	х	х	Low on refrigerant charge	Locate leak, repair and recharge by weight (not by superheat)
	х	х	Restricted thermal expansion valve	Replace
Insufficient capacity	х	х	Defective reversing valve	See WSHP-IOM-# for touch test chart
	х	х	Thermostat improperly located	Relocate
-	х	х	Unit undersized	Recalculate heat gains/losses
	х	х	Inadequate water flow	Increase GPM
	х	х	Scaling in heat exchanger	Clean or replace
	-	х	Water too hot	Decrease temperature
	х	—	Water too cold	Increase temperature
	х	х	Filter drier blocked	Replace
	х	х	Defective reversing valve	Check or replace
		х	Inadequate GPM	Increase water flow to unit
		х	Water too hot	Decrease temperature
High pressure switch open	х	—	Inadequate air flow	Check, clean blower and coil
righ pressure switch open	х	—	Dirty filter	Clean/replace
	х	х	Overcharged with refrigerant	Decrease charge
	х	х	Defective pressure switch	Check or replace
	-	х	Trash in heat exchanger	Backflush
		х	Low water flow	Increase GPM
	х	х	Overcharge of refrigerant	Decrease charge
High head pressure	х	х	Non-condensable in system	Evacuate and recharge by weight
	х	х	Water too hot	Decrease temperature
	х	_	Dirty filter	Clean / replace
	х	_	Inadequate air flow	Check, clean blower and coil

## Table 59. Troubleshooting table (continued)

Problem	Heating	Cooling	Cause	Correction
	х	х	Undercharged	Locate leak, repair and recharge
	х	х	Restricted thermal expansion valve	Repair / replace
Low suction pressure	—	х	Inadequate air flow	Check, clean blower and coil
	—	х	Dirty filter	Clean/replace
	х	_	Inadequate GPM	Increase GPM
	х	_	Inadequate GPM	Increase GPM
	х	_	Water too cold	Increase temperature
	_	х	Inadequate air flow	Increase CFM
Low pressure switch open	_	х	Dirty filter	Clean/replace
	х	х	Undercharged with refrigerant	Increase charge
	х	х	Defective pressure switch	Replace
	х	х	Heat transfer fluid too cold	Raise water temperature

# **Wiring Diagrams**

This section contains wiring diagrams and isolation valve wiring connections.

# Table 60.Isolation valve wiring connections (0.5 to 5<br/>tons)

Control Type	3-Wire Isolation Valve Connections (0.5 to 5 tons)				
	Common Close Open				
Deluxe 24V	93B	92B	91B		

**Note:** For field installed valves, wires 91B, 92B and 93B are coiled behind control box. For field-provided two wire valves connect to wires 91B and 93B.

# Table 61. Isolation valve wiring connections (6 to 25 tons)

Control Type	3-Wire Honeywell Isolation Valve Connections (6 to 25 tons)			
	Blue	Black		
Deluxe 24V	1TB1-6	1TB1-1	1TB1-4	

**Note:** Wiring diagrams can be accessed via e-library by entering the diagram number in the literature order number search field or by calling technical support.

Number	Unit Description	Model
23115845	DELUXE CONTROLS 2 STAGE HEAT PUMP w/ECM MOTOR, SINGLE PHASE	DX only

# **Warranty Information**

# **Standard Warranty**

The standard water-source heat pump warranty is Trane's parts-only warranty, running 12-months from start-up, not to exceed 18-months from shipment.

There is a standard 5-year compressor warranty.

# **Extended Warranty**

The optional extended warranty is a second through fifth year warranty. The time starts at the end of the standard 1 year coverage through the fifth year.

These extended warranties apply only to new equipment installed in domestic Trane Commercial Systems Group sales territories and must be ordered prior to start-up.

Trane - by Trane Technologies (NYSE: TT), a global innovator - creates comfortable, energy efficient indoor environments for commercial and residential applications. For more information, please visit trane.com or tranetechnologies.com.

Trane has a policy of continuous product and product data improvements and reserves the right to change design and specifications without notice. We are committed to using environmentally conscious print practices.
