Features and Benefits

Factory Packaged – What You Need – When You Need It

Trane Blower Coil air handler, models BCHE and BCVE, accommodate a variety of applications while providing a low-cost method of air conditioning and/or heating buildings. These compact, low-profile units fit in small spaces and may be floor or ceiling mounted. With minimal effort, they can be relocated within the building as needs change.

Blower coils are light-duty air handlers, ranging from 1.0 to 10 tons nominal capacity. They are typically used in schools, hospitals, offices, stores, and similar applications. Trane Blower Coils are UL listed to U.S. and Canadian safety standards for the following:

- 115, 208, 230, 277, 460, and 575 volt 60 Hz motors
- 220, 240, 380, and 415 volt 50 Hz motors

Figure 2. Horizontal blower coil

Proven Performance

Trane combines comprehensive performance certification by AHRI with thorough laboratory testing and advanced manufacturing methods. Together, these elements help assure that each Trane air handler operates predictably and reliably throughout the life of the unit.

Unlike other rating methods that check fan performance alone, Trane units are performance-tested in accordance with AHRI Standard 430. This certification process evaluates the air handler on the basis of airflow, static pressure, fan speed, and brake horsepower.

Heating and cooling coils are rigorously tested and certified with AHRI Standard 410 to assure that they, too, deliver published performance.

AHRI Standard 260 is the first ducted-air-handler sound rating procedure. It is intended to provide engineers with better, more accurate, ducted sound power levels so that they can design quieter and more cost-effective comfort systems. Sound ratings for Trane air handlers have been developed from extensive AHRI Standard 260 testing and laboratory data.

Single Source Responsibility

Equipment and interoperable controls, engineered and provided by a single manufacturer, provide faster construction cycles and simplify job-site coordination efforts. This simplification reduces installation time, expense, and risk. Trane equipment and controls package provides the optimal performance when integrated in a Trane Earthwise™ system. This is a powerful system architecture

Features and Benefits

that unifies Trane HVAC equipment, direct digital control, and building management into a cohesive whole with an assured source of support. This system is managed with the Tracer® building management system.

Valve Kits

All Blower Coil air handlers are available with factory-provided valve kit options for field installation using field-supplied interconnecting piping. Kits are available with a variety of control valve options:

- Two- or Three-way
- 1/2-in., 3/4-in., 1-in., or 1 1/4-in.
- Two-position or Modulating Control
- Pressure Independent Control (PIC)

The kit also has shut-off ball valve(s), a strainer, and a circuit setter balancing valve or PIC valve. Kits with a three-way control valve also include a balancing fitting.

Energy Efficiency

Trane's commitment to providing premium quality products has led to the exclusive use of Electronically Commutated Motors (ECM) in all blower coil models. These brushless DC motors incorporate the latest technology for optimized energy efficiency, acoustical abatement, maintenance free and extended motor life. Each motor comes with a VelociTach™ motor control board that allows for programmability, soft ramp-up, better airflow control, and serial communication.

Trane units equipped with ECMs are significantly more efficient than permanent split capacitor (PSC) motors or belt-drive motors and enable single-zone VAV control.

Single-zone VAV control varies the fan speed as the zone cooling or heating load changes, and can result in lower operating costs and improved occupant comfort compared to constant-speed units.

Controls

Trane offers a broad array of control options, from a simple control interface (CSTI) to the Tracer® UC400-B/Symbio™ 400-B controller.

Note: *Factory addressing is available for Symbio 400-B and UC400-B Air-Fi® WCI controller types. This option allows configuration of unit prior to ship, reducing field setup time.*

CSTI

The control interface is intended to be used with a field-supplied, low-voltage thermostat or controller. The control box contains a disconnect switch (optional for units with electric heat). All end devices are wired to a low-voltage terminal block and are run-tested, so only a power connection and thermostat connection is needed to commission the unit. Changeover sensors and controls are provided when a change-over coil is selected.

Thermostat

All controls are factory-mounted and tested to minimize field setup and improve reliability. A factory provided low voltage wall mounted thermostat is available.

All wall-mounted zone sensors/thermostats require only low voltage control wiring from the device to the unit control box (no line voltage). The thermostat is factory configured based on selected options.

Tracer® Controller

The Tracer controller UC400-B offers the combined advantages of simple and dependable operation with the latest Trane-designed controller. Standard control features include options normally available on more elaborate control systems. UC400-B is available factory configured or can be field configured using Tracer TU.

This is the industry's first solution that is factory-mounted, wired, and programmed for infinite modulation of fan speed based on space loads, using the Tracer UC400-B.

The Symbio 400/Symbio 400-B is a multi-purpose, programmable (or application-specific controller) that provides direct-digital zone temperature control. The controller can operate as a stand-alone device or as part of a building automation system (BAS). Communication between the controller and a BAS occurs on an open standard with inter-operable protocols used in Building Automation and Control Networks (BACnet®). Programming is done by means of the Tracer TU service tool. The Symbio 400-B is designed to be a one-to-one replacement for the UC400-B.

End Devices

Optional factory-mounted end devices such as a condensate float switch, low-limit (freezestat), frostat, control valves and actuators are available. Factory-installed and -wired electric heat features single-point power connection.

Flexibility

The Trane Blower Coil is available in either horizontal or vertical configurations. Horizontal units are typically ceiling suspended via threaded rods. Mounting brackets are provided in all four corners on top and bottom to pass the rods through. Vertical units are typically floor mounted with legs. Legs are required for seismic applications. Vertical unit sizes 72 - 120 ship in two pieces. Smaller capacity vertical units (24-60) are floor mounted and ship in one piece.

Blower Coils have acoustical benefits because they are typically located outside the occupied space, either in the ceiling or in a closet. This limits the amount of sound transmission (radiated) directly from the unit to the occupant. These units are applied with discharge ductwork, which is frequently lined to help reduce the sound transmission (discharge) through the ductwork into the occupied space. To further aid in reducing sound an optional inlet or discharge attenuator is selectable. Blower coils utilize a direct-drive motor solution for all units which eliminates the single phase motor hum which is evident in capacitor split motors in belt-drive applications. An optional inlet or discharge attenuator is selectable to provide flexibility in duct connection locations and reducing sound.

Coil Options

Trane blower coils feature a wide variety of coil options that include:

- Four-, six-, eight-row hydronic cooling or heating
- Three-, four-, or six-row DX coils can be utilized with a heat pump or VRF system
- One- or two-row heating coil in either the preheat or reheat position

Electric Heat

A factory installed open-wire electric heater is available in a wide variety of voltages and kW's. Available with single stage, dual stage, or SCR modulating heat. All units have a single point power connection. Optional heater fuses and a heater door interlocking disconnect switch are available.

Filter Placement Options

Units without accessories have a flat filter frame for 1-, 2-, or a combination 2-inch pre and 2-inch final filter on the air entering side of the unit. Other filter placement options include:

- Angle filter box for 2-inch filters
- Combination angle filter/mixing box
- Bottom/Top access filter box that accommodates 2-inch filters. This option allows easy filter access through a hinged door, from the bottom or top of the unit.

Motor Options

Direct-drive motors range from 1/2 to 5 horsepower in a wide range of voltages. All motors have internal current overload protection, permanently sealed ball bearings, and rubber grommets on the mounting brackets to reduce noise and vibration transmission.

Motors come factory programmed for specific job requirements. Motors speeds have the ability to be adjusted on the job site with out the requirement of specialized tools. This enables the unit airflow to be adjusted for changes to design static pressures.

Indoor Air Quality

Indoor air quality is becoming a greater concern every day. Trane provides the most complete indoor air quality options of any manufacturer.

Filtration

The improved static pressure capability for units without an accessory have a flat filter frame that can accommodate 1-, 2-, or a combination 2-inch pre and 2-inch final filter on the air entering side of the unit. An optional bottom/top filter access box is also available for improved accessibility.

An optional angle filter box (2-inch only), or combination angle filter/mixing box, provides extra filter face area, which results in low face velocities and low pressure drop. With increased face area, the angle filters have substantially more dust-holding capacity than conventional flat filters. MERV 8 or MERV 13 pleated angle or flat filters options are available.

Accessibility and Cleanability

Trane Blower Coils have 1-inch dual density insulation that meets NFPA90A and UL181, which is designed to withstand high velocities. Trane optionally offers double wall casing on the main unit and accessories to help with cleanability.

Drain Pans

Trane Blower Coil uses non corrosive drain pans made from a polymer or optional stainless steel and sloped in both directions to drain properly. The drain pans are easily removable and cleanable. Also, the main and auxiliary connections are on the same side. Small capacity vertical units (24-60) include an internal condensate trap.

Coils mount above—not in—the drain pan and are not a structural part of the unit. The coils are easily removable and slide in and out on rails for cleaning.

Ventilation

The optional mixing box delivers ventilation air directly to each unit. When the unit is equipped with a UC400-B/Symbio™ 400-B controller, the mixing box functions as a zero to 100 percent economizer to improve energy efficiency. For units configured to automatically switch between high and low fan speeds, the UC400-B/Symbio™ 400-B controller automatically adjusts the mixing box damper to provide the correct amount of fresh air to the space at all fan speeds.

Blower Coil units are draw-thru configurations that use direct-drive fan motors with higher horsepower and static pressure capability than fan coils. This makes them an excellent choice as an entry level air handler for use in an air supply ductwork system with diffusers—rather than a direct discharge system—because it enhances the space air mixing and ventilation effectiveness.

Dehumidification

For direct control of space humidity, a blower coil can be configured with a hydronic heating coil in the reheat position and equipped with a UC400-B/Symbio™ 400-B controller. These controllers can independently modulate the cooling and heating coils to directly control both temperature and humidity in the space.

Easy to Service

The coils and motor are easily replaced within minutes, even when the unit is suspended. Coils slide in and out by removing the coil access panel and a few screws at the rear of the unit. With the bottom filter access option, filters are easily accessed from the bottom of the unit. If the motor requires servicing, only the motor side requires access. The flat filter section has a tool-less access door.

Optional Accessory Sections

These accessory sections make the BCHE/BCVE product more flexible:

- Mixing box (size 12-120 Horizontal and size 72-120 Vertical)
- Angle filter box (size 12-120 Horizontal and size 72-120 Vertical)
- Angle filter and mixing box section (size 12-120 Horizontal and size 72-120 Vertical)
- Bottom hinged access filter box (size 12-120 Horizontal and size 72-120 Vertical)
- Discharge Attenuator (all sizes)
- Return Attenuator (all sizes)

Mixing Box

The mixing box option ships separately and has internal low-leak dampers and access panels on both sides. The mixing box is insulated the same as the main unit: matte or double wall, as ordered. The mixing box can be easily rotated in field to allow "back/ bottom" or "back/top" dampers. The dampers are linked together. The back damper actuator can be selected as normally open or normally closed.

Angle Filter or Angle Filter/Mixing Box Combination

The angle filter can be combined with the mixing box as one accessory module. The angle filter frame accommodates only 2-inch filters.

Features and Benefits

Bottom (or Top) Access Filter

The bottom (or top) access filter section accommodates 2-inch filters and improves unit serviceability in ceiling (or floor) applications.

Return and Discharge Attenuators

Attenuators allow for flexible return or discharge ducting configurations. Discharge attenuators also reduce noise transmission to the customer space.

Application Considerations

Single-Zone, Constant Volume Applications

Trane Blower Coil air handler offers a wide range of application flexibility between the fan coil unit and Climate Changer™ air handlers. Units are available in ten nominal capacities ranging from 1.0 to 10 tons cooling and 400 to 4000 cfm airflow. The basic unit is available in horizontal (model BCHE) and vertical (model BCVE) configurations.

The single-zone, constant volume applications discussed in this section are:

- Two-pipe hydronic units
- Two-pipe hydronic units with electric heat
- Four-pipe hydronic units
- DX cooling or heat pump
- Single-zone VAV
- Variable Refrigerant Flow (VRF)

Two-Pipe Hydronic Units

The standard Blower Coil is equipped with a hydronic coil. The unit can perform cooling only, heating and cooling (changeover system), or heating only. In a changeover system, the unit cools during the spring, summer, and fall seasons (summer mode) and heats during the winter season (winter mode).

Use the Trane Select Assist™ program for specific design criteria such as flow rate, temperature rise/drop, pressure drop, glycol mixtures, and capacity.

When selecting two-pipe changeover units, note that Trane Select Assist will only provide output that meets both the cooling and heating capacity requirements. Because cooling and heating capacity requirements for a given unit may differ significantly, a given coil may be optimally sized for one load and over/under sized for the other load.

Two-Pipe Hydronic Units With Electric Heat

With the addition of electric heat, the two-pipe system can heat or cool. In the non-changeover system, the main coil is always used for cooling and the electric heater is always used for heating. In the changeover system, during the summer mode (spring, summer and fall), the main coil is used for cooling and electric heater is used for heating. During the winter mode, the main coil is used for heating and the electric heater is disabled.

Two-pipe systems with electric heat are an economical solution to intermediate season (spring and fall) comfort problems associated with straight two-pipe systems. In moderate climates or where electric rates are low, non-changeover systems are typically used. In climates with significant heating loads and/or high electric rates, a changeover system—to allow hydronic heating—is typically used.

All units with factory mounted electric heat are UL listed and interlocked with the fan motor switch. A call for Electric heat operation will turn the fan on. Motors controls are synchronized with fan/valve operation to ensure safe operation and that two modes of heat are not operating simultaneously. A transformer is supplied on any voltage unit, eliminating the need for field installation of a step-down transformer. Units come with either contactors or relays on the electric heat. A high temperature cutout with automatic reset is provided as an integral part of the elements to de-energize the electric heat in the event of a malfunction.

Changeover in Two-Pipe Systems

Changing between cooling and heating modes in a two-pipe system requires energy to heat or cool the mass of water in the piping system at switchover. ASHRAE Standard 90.1–2001 defines specific requirements for minimizing the energy impact of this switchover:

- The system must allow a deadband between changeover from one mode to the other of at least 15°F outdoor-air temperature.

Application Considerations

- The system must include controls that allow the system to operate in one mode for at least four hours before changing to the other mode.
- Reset controls must be provided to allow heating and cooling supply-water temperatures, at the changeover point, to be no more than 30°F apart.

Four-Pipe Hydronic Units

The addition of a one-row or two-row heating coil to the basic blower coil makes it compatible for a four-pipe cooling and heating system. The heating coil is available factory installed in either the preheat or reheat position.

Four-pipe systems solve the intermediate season (spring and fall) comfort problems associated with straight two-pipe systems because they only either cool or heat year-round. However, they do require chiller and boiler operation to be available to operate year-round.

When making the choice between a two or four-pipe system, also consider:

- Cooling/heating loads in perimeter zones of the building
- Importance of temperature and humidity control for the zone
- First cost

Trane Select Assist™ allows independent selection of the cooling and heating coils for flexibility in flow rates, pressure drops, temperature rise/drop, and fluid type.

DX Cooling Units

Blower coils with a DX cooling coil will often be connected to an air-cooled condensing unit. Some condensing units have two, independent refrigeration circuits; DX coils on BCHE and BCVE sizes 12 to 120 are single-circuited, with the following exceptions, which are dual-circuited:

- Six-row coils on BCHE sizes 54 to 120
- Six-row coils on BCVE sizes 72 to 120

Note: Do not manifold two independent refrigeration circuits into a single-circuited DX (evaporator) coil.

Dehumidification

Dehumidification is possible with the following types of units:

- Two-pipe unit with electric heat
- Four-pipe units with reheat

Blower coils equipped with a UC400-B/Symbio™ 400-B controller and a heating source (electric or hydronic) in the reheat position will provide direct control of space humidity. If the space humidity level does not exceed the desired upper limit, the unit responds to reduced cooling load by modulating the control valve and, if in AUTO mode, switching between fan speeds. However, if the space humidity level rises above the upper limit, the capacity of the cooling coil is increased, overcooling the air to maintain the space humidity below the upper limit. Then, the capacity of the heating source modulates, adding a small amount of heat to temper the air and avoid overcooling the space.

The UC400-B/Symbio 400-B controller responds to a signal from a humidity sensor installed in the space or a signal from a building automation system, and independently modulates the cooling and heating coils to directly control both temperature and humidity in the space. While this configuration can directly control indoor humidity levels, it does require the boiler (or other source of heat) to be available year-round.

Location and Installation

For applications in spaces where sound levels may be critical, refer to Trane Select Assist acoustic data to determine if further attenuation may be required. Install horizontal units over false ceilings. Install vertical units in closets or mechanical rooms.

Horizontal units are installed by suspending the corners of the unit with threaded rods. Use suitable vibration isolators and take the following precautions to comply with generally accepted installation practices. Vertical units are floor mounted on factory supplied legs.

- Use flexible duct connectors or supply and return sides (if ducted).
- Use acoustic lining on the inside of main supply duct for noise control.
- Do not attach ceiling suspension wires to unit or through ducts.
- Locate return air grilles as far as possible from the unit to avoid noise transmission.
- Design and install ductwork as per ASHRAE guides, SMACNA, and local code requirements.

Acoustics

Controlling outdoor and equipment noise within the occupied space is increasingly important to system designers and building occupants/owners. Therefore, give proper consideration to this subject in the application of the Blower Coil. Applying an inlet or discharge attenuator will provide further acoustic benefits.

Selecting fan and coil combinations is inherently flexible for sound-sensitive applications. In such instances, a fan running at low speed with a high capacity coil normally yields satisfactory results. It also may be desirable to select a larger nominal capacity unit and operate it at less than nominal airflow for further acoustic benefit.

BCHE/BCVE sound power, Lw, data for ducted discharge, inlet + casing, and casing radiated components is available in Trane Select Assist™. The sound power provided includes accessory attenuation. This sound power data is useful in estimating the sound levels in the occupied space for a given application.

Operating Limitations

Reference the General Data section for minimum and maximum operating limits. Units must not operate above maximum fan rpm or unit airflow. Unit operation above the maximum fan rpm will drastically reduce bearing life and may result in catastrophic failure. Operating the unit above the maximum airflow in the cooling mode may result in unsatisfactory operation due to water carryover from the coil. In addition, it is often uneconomical to operate a unit at its maximum rpm due to greater motor power requirements.

The unit may not perform at an optimal acoustical performance level if it operates in the fans traditional stall region.

Do not operate units with electric heat below the minimum airflow limit to prevent excessive leaving air temperatures and electric heat limit trips.

Do not operate hydronic and electric heat simultaneously to prevent excessive leaving air temperatures and limit trips. Electric heat units have a lockout switch to disable the electric heater if the temperature off the hydronic coil is greater than 95°F.

Do not operate units with a leaving air temperature above 104°F for units with a single-phase motor. Do not operate units with a leaving air temperature above 130° F for units with a three-phase motor.

Do not operate coils above the water flow limits to prevent erosion and noise. A minimum or self venting water flow rate is also listed in the General Data Section. If the coil is set to operate below this flow rate, vent it periodically by flushing at a higher flow rate.

Do not operate valve kits and water valves above the water flow limit to prevent erosion and noise. Water valves supplied with Blower Coils as accessories are intended for use in treated closed loop chilled or hot water systems.

Note: *Do not use valves with open or potable water systems. Untreated water may cause scaling and particulate collection interference with the valve function, and reduce the life and effectiveness of the valve.*

Model Number Description

Digit 1, 2, 3, 4 — Unit Model

BCHE = Horizontal Blower Coil
BCVE = Vertical Blower Coil

Digit 5, 6, 7 — Unit Size

012 = Unit size 12 - 1 Ton
018 = Unit size 18 - 1.5 Ton
024 = Unit size 24 - 2 Ton
036 = Unit size 36 - 3 Ton
048 = Unit size 48 - 4 Ton
054 = Unit size 54 - 4.5 Ton
060 = Unit size 60 - 5 Ton
072 = Unit size 72 - 6 Ton
090 = Unit size 90 - 7.5 Ton
120 = Unit size 120 - 10 Ton

Digit 8 — Unit Voltage

A = 115V/60 Hz/1 pH
B = 208V/60 Hz/1 pH
C = 230V/60 Hz/1 pH
D = 277V/60 Hz/1 pH
E = 208V/60 Hz/3 pH
F = 230V/60 Hz/3 pH
G = 460V/60 Hz/3 pH
J = 220V/50 Hz/1 pH
K = 240V/50 Hz/1 pH
L = 380V/50 Hz/3 pH
M = 415V/50 Hz/3 pH
N = 575V/60 Hz/3 pH

Digit 9 — Insulation

A = Matte faced insulation 1-in.
B = Double wall insulation 1-in.

Digit 10, 11 — Design Sequence

A0 = Design Sequence

Digit 12 — Motor/Control Box Location or Inlet Location

A = Same side as coil connections
B = Front return
C = Bottom return

Digit 13 — Coil Connection Side

0 = None
1 = PVC drain pan right hand coil
2 = PVC drain pan left hand coil
3 = SST drain pan right hand coil
4 = SST drain pan left hand coil
5 = PVC drain pan front connection
6 = SST drain pan front connection

Digit 14 — Coil #1 First Coil in Air Stream

0 = None
A = 1-row hydronic preheat
B = 4-row hydronic
C = 6-row hydronic
D = 4-row hydronic with auto change over
E = 6-row hydronic with auto change over
G = 3-row DX 3/16-in.
H = 4-row DX 3/16-in.
J = 6-row DX 3/16-in.
K = 4-row DX 3/16-in. (0.049) Dist, Heat Pump
L = 6-row DX 3/16-in. (0.049) Dist, heat pump
M = 8-row hydronic
N = 8-row hydronic with auto change over

Digit 15 — Coil #2 Second Coil in Air Stream

0 = None
A = 1-row hydronic reheat
B = 4-row hydronic
C = 6-row hydronic
G = 3-row DX 3/16-in.
H = 4-row DX 3/16-in.
J = 6-row DX 3/16-in.
K = 4-row DX 3/16-in. Dist, Heat Pump
L = 6-row DX 3/16-in. Dist, heat pump

Digit 16 — Motor Horsepower

2 = 0.5 HP (0.4 HP 3PH 50 HZ)
4 = 1 HP (0.8 HP 3PH 50 HZ)
5 = 1.5 HP (1.25 HP 3PH 50 HZ)
7 = 3 HP (2.5 HP 3PH 50 HZ)
8 = 2.3 HP
9 = 3.5 HP
A = 5 HP (4.5 HP 3PH 50 HZ)

Digit 17 — Reserved

0 = Factory Set

Digit 18 — Electric Heat Stages

0 = None
1 = 1-stage
2 = 2-stage
3 = SCR

Digit 19, 20, 21 — Electric Heat kW

000 = None
010 = 1.0 kW
050 = 5.0 kW
100 = 10.0 kW
150 = 15.0 kW
200 = 20.0 kW
240 = 24.0 kW
300 = 30.0 kW

Digit 22 — Reserved

0 = Factory Set

Digit 23 — Electric Heat Options

0 = None
A = Interlocking disconnect switch
B = Interlock disc and heater fuse

Digit 24 — Filters

0 = None
A = 1-in. Throwaway
B = 2-in. MERV 8
C = 2-in. MERV 13
D = 2-in. MERV 8 and 2-in MERV 13 Combination

Digit 25 — Accessory Section

0 = None
B = Angle filter box
C = Angle filter/Mix box
D = Bottom (or Top) access filter mod
E = Discharge attenuator
G = Discharge attenuator and angle filter box
H = Discharge attenuator and angle filter/mixing box
J = Discharge attenuator and Bottom (or Top) access filter mod
L = Return attenuator with angle filter box
M = Return attenuator with Bottom (or Top) access filter mod
P = Return attenuator and Discharge attenuator and Bottom (or Top) access filter mod
Q = Return attenuator and Discharge attenuator and angle filter box
R = Bottom (or Top) access filter mod and mixing box

Digit 26 — Control Type

A = CSTI fan status
B = CSTI
C = UC 400-B
D = UC 400-B and WCI
E = Symbio™ 400-B
F = Symbio 400-B and WCI
G = Thermostat

Digit 27 — Coil #1 Control Valve Type

0 = None
A = 2-way, 2 position N.C.
B = 2-way, 2 position N.O.
C = 3-way, 2 position N.C.
D = 3-way, 2 position N.O.
E = 2-way, modulating
F = 3-way, modulating
G = Field supplied, 2 position N.C.
H = Field supplied, 2 position N.O.
J = Field supplied, modulating
K = Field supplied, analog (2-10 Vdc)

Digit 28 — Coil #1 Control Valve Cv

0 = None
A = 2-way 2.3 Cv 3/4-in. valve
B = 2-way 3.3 Cv 3/4-in. valve
C = 2-way 4.6 Cv 3/4-in. valve
D = 2-way and 3-way 7.4 Cv 1-in. valve
E = 2-way and 3-way 10.0 Cv 1-in. valve
F = 3-way 1.0 Cv 1/2-in. valve
G = 3-Way 2.7 Cv 1/2-in. valve
H = 3-Way 4.6 Cv 3/4-in. valve
J = 2-way PIC 0.9 GPM
K = 2-way PIC 2 GPM
L = 2-way PIC 4.3 GPM
M = 2-way PIC 9 GPM

Digit 29 — Reserved

0 = Factory set

Digit 30 — Coil #2 Control Valve

0 = None
A = 2-way, 2 position N.C.
B = 2-way, 2 position N.O.
C = 3-way, 2 position N.C.
D = 3-way, 2 position N.O.
E = 2-way, modulating
F = 3-way, modulating
G = Field supplied, 2 position N.C.
H = Field supplied, 2 position N.O.
J = Field supplied, modulating
K = Field supplied, analog (2-10 VDC)

Digit 31 — Coil #2 Control Valve Cv

0 = None
A = 2-way 2.3 Cv 3/4-in. valve
B = 2-way 3.3 Cv 3/4-in. valve
C = 2-way 4.6 Cv 3/4-in. valve
D = 2-way and 3-way 7.4 Cv 1-in.
E = 2-way and 3-way 10.0 Cv 1-in. valve
F = 3-way 1.0 Cv 1/2-in. valve
G = 3-way 2.7 Cv 1/2-in. valve
H = 3-way 4.6 Cv 3/4-in. valve
J = 2-way PIC 0.9 GPM
K = 2-way PIC 2 GPM
L = 2-way PIC 4.3 GPM
M = 2-way PIC 9 GPM

Digit 32 — Reserved

0 = Future offering

Digit 33 — Reserved

0 = Future offering

Digit 34 — Mixing Box Damper Actuator

0 = None
2 = Modulating, N.C.
2 = Modulating, N.O.

Digit 35 — Factory Mounted Control Options

0 = None
A = Condensate overflow
B = Condensate Overflow and Low Limit

Digit 36 — Control Options 2

0 = None
A = Outside air sensor, field mounted
B = Discharge air sensor
C = Outside air and discharge air sensor

Digit 37 — Control Options 3

0 = None
A = Dehumidification with local sensor
B = CO₂ sensor
C = Air-Fi® Dehumidification and CO₂
D = Air-Fi Dehumidification
E = Air-Fi CO₂

Digit 38 — Zone Sensors

0 = None
A = Wall-mounted temperature sensor (OCC/UNOCC, COMM)
B = Wall-mounted
C = Wall-mounted temperature sensor (SP, OALMH, OCC/UNOCC, COMM)
D = Wall-mounted display sensor (SP, OALHH, COMM)
E = Wireless display sensor, Unit-mounted receiver (SP, OALMH)
F = Wall-mounted FSS

Digit 39 — Seismic Certification

0 = None
A = IBC seismic certification
B = OSHPD seismic certification

Digit 40 — Extra filter

0 = None
1 = Extra 1-in. throwaway ship loose
2 = Extra 2-in. MERV 8 pleated throwaway ship loose
3 = Extra 2-in. MERV 13 pleated throwaway ship loose
4 = Extra 2-in. MERV 8 and MERV 13 pleated throwaway ship loose

Table 1. BCHE coil general data (continued)

- (a) Area is rounded, use length and width to calculate the precise area.
- (b) Coil width = Length in the direction of a coil header, typically vertical.
- (c) Coil length = Length of coil in direction of the coil tubes, typically horizontal and perpendicular to airflow.
- (d) The minimum waterflow at 1-1.5 fps tubeside velocity is to ensure the coil self-vents properly. There is no minimum waterflow limit for coils that do not require self venting. See "Water Coil Piping" section for minimum self venting velocities.
- (e) Maximum gpm limits are to prevent erosion and noise problems.
- (f) DX coil height and width dimensions are same as comparable hydronic coils. Four- and six-row DX coil dry weight dimensions are same as comparable 4-row and 6-row hydronic coils. A 3-row DX coil dry weight is 25% less than a comparable 4-row hydronic coil. Internal volumes exclude headers. Weights are rounded up to the nearest pound.

Notes:

1. Minimum air flow limits apply to units with hot water or electric heat only. There is no minimum airflow limit on cooling only units. Maximum airflow limits are to help prevent moisture carryover.
2. 2.3 and 3.5 are only available at 575V.

Notes:

1. Cooling coil APD is for a 100 percent fully wetted fin.
2. Heating coil APD is for dry fin surface.

Controls

Why Trane Controls?

Trane offers a broad range of control packages from a field convertible end-device package, to a complete building automation system solution with BACnet® controls.

Trane controls are factory-mounted, wired, tested and configured or programmed with Trane application expertise to provide comfort, efficiency, and reliability, as well as single-source warranty and service. With Trane integrated controls, the installed costs are lower because the equipment has turn-key factory controls and every component of the system is optimized to fit with the controller. Trane installs not only the controller, but also the hardware that works intimately with the controller to allow the system to function properly (i.e., valves, dampers, actuators, etc.).

Note: Some Trane controllers have the ability to be pre-addressed in the factory. If addressing is not provided, the controllers will be kept at the default setting.

Table 7. Tracer® controller input/output summary

Binary outputs	UC400-B/Symbio™ 400-B
Variable speed fan control	X
2-position hydronic valve	X
1-stage electric heat	X
Modulating mixed air damper	X
Modulating hydronic valve	X
2-stage electric heat	X
Reheat (hydronic)	X
Generic	X
Binary inputs	
Condensate overflow detection	X
Low temperature detection	X
Occupancy	X
Generic input	X
Analog inputs	
Zone temperature	X
Setpoint	X
Fan mode: auto, high, medium, low	X
Entering water	X
Discharge air	X
Outside air	X
Generic	X
Hydronic Valve	X
SCR Electric Heat	X

Note: The generic input and output are for use with a Tracer® Summit systems only.

VelociTach™ Motor Control Board

The VelociTach motor control board controls and reports the performance of up to two Trane brushless DC (BLDC) motors.

Figure 8. VelociTach motor control board

The motor control board also:

- Coordinates the operation of the fan in response to electric heat behavior and electric behavior in response to hydronic heat behavior.
- Incorporates a user interface that allows adjustment of certain unit parameters and provides constant feedback on motor operation.
- Integrates service and troubleshooting tools.
- Integrates a versatile configurable auxiliary temperature sensor.
- Incorporates various safety and lockout features, such as maintaining proper fan speeds if electric heat is called for.

Status Display

Figure 9. Status display

The motor control board contains a four-digit, seven-segment display that is used to present information in a format close to real-world language, while having a small-form factor. Most characters are immediately recognizable; however, refer the screen representation of alphabetical characters and numeric characters shown in the following tables.

Manual Fan Speed Switch

A fan speed control is selectable on units with CSTI options. It provides variable speed of the motor RPM between the low and high speed factory settings.

Figure 10. Fan speed switch

Customer Supplied Terminal Interface (CSTI)

The CSTI is intended to be used with a field-supplied, low-voltage thermostat or controller. The control box contains a relay board which includes a line voltage to 24-volt transformer and disconnect switch (for non-electric heat units). All end devices are wired to a low-voltage terminal block and are run-tested, so the only a power connection and thermostat connection is needed to commission the unit. Changeover sensors and controls are provided whenever a change-over coil is selected. When N.O. valves are selected, inverting relays are provided for use with standard thermostats.

Figure 11. CSTI adapter board and field connections

The CSTI adapter board provides all the hookups as the standard adapter board, but in addition, provides hookups for valve control (main and pre-heat or re-heat), electric heat control, and damper control. Screw terminal blocks provide convenient access to fan controls and to end device control. In addition, a courtesy 10-Vdc supply is provided for use with an external potentiometer or rheostat. The 10-Vdc supply supports up to 10 mA draw.

Thermostat

The low voltage, wall mounted thermostat is available factory or field installed. Thermostat control is available with 2 position valves, low limit protection, and condensate overflow protection, and is compatible with field supplied 2 position damper actuators. The thermostat is capable of controlling cooling (hydronic or DX), heating (hydronic, electric heat or steam), and automatic changeover all with continuous fan or thermostat controlled fan speeds.

UC400-B/Symbio 400-B Controller

The Tracer® UC400-B/Symbio™ 400-B single-zone VAV controller can be used in a stand-alone application or as part of a Tracer control system.

In the stand-alone configuration, UC400-B/Symbio 400-B receives operation commands from the zone sensor and/or the auto changeover sensor (on auto changeover units). The entering water temperature is read from the auto changeover sensor and determines if the unit is capable of cooling or heating. The zone sensor module is capable of transmitting the following information to the controller:

- Timed override on/cancel request
- Zone setpoint
- Current zone temperature
- Fan mode selection (off-auto-high-med-low)

For optimal system performance, units can operate as part of a Tracer® SC building automation system. The controller is linked directly to the Tracer SC via a twisted pair communication wire, requiring no additional interface device (i.e., a command unit). The Tracer control system can monitor or override UC400-B/Symbio 400-B control points. This includes such points as temperature and output positions.

Tracer Controller Features

The Tracer® family of controllers, UC400-B/Symbio™ 400-B, offer the combined advantages of simple and dependable operation with the latest Trane-designed controller. Standard control features include options normally available on more elaborate control systems. All control options are available factory-configured or can be field-configured using Tracer® TU service software. For more detailed information, refer to Tracer® UC400/UC400-B Programmable Controllers for Blower Coil, Fan Coil, and Unit Ventilator Installation, Operation, and Maintenance (BAS-SVX48*-EN) and Symbio 400-B/500 Programmable Controllers For Blower Coil, Fan Coil, and Unit Ventilator Installation, Operation, and Maintenance (BAS-SVX093*-EN).

Features Available on All Controllers

The following control functions are standard features on units with UC400-B/Symbio™ 400-B.

Entering Water Temperature Sampling Function

A system that uses a two-way control valve option might not sense the correct entering water temperature during long periods when the control valve is closed. If the demand for heating or cooling does not exist for a long period, the entering water will eventually approach ambient temperature.

Using the entering water temperature sampling function, the controller provides accurate two-pipe system changeover-without sacrificing the benefits of two-way control valves. Also, it eliminates inefficient bleed or bypass lines that can allow unnecessary waterflow through the system.

This function periodically samples the entering water temperature by opening the hydronic valve. The valve opens for 20 seconds to allow the water temperature to stabilize, and then the controller reads the entering water temperature for up to three minutes to see if the correct water temperature is available for the selected operating mode.

The entering water temperature must be five degrees or more above the space temperature to allow hydronic heating and five degrees or more below the space temperature to allow hydronic cooling. If the correct water temperature for the operating mode is available, the unit begins normal heating or cooling operation. If the correct water temperature is not available, the controller closes the control valve and waits 60 minutes before attempting to sample the entering water temperature again.

A factory-mounted thermistor senses the entering water temperature on changeover cooling/ heating coil units. If the fan coil has a factory-mounted piping package, the sensor is strapped to the entering water pipe. If the fan coil does not have a piping package, the sensor is coiled in the end pocket for mounting on customer-supplied piping. This sensor must detect accurate water temperature for proper changeover.

Automatic Heat/Cool Mode Determination

The controller automatically determines whether heating or cooling is needed-based on space and system conditions. Using a proportional/integral (PI) control algorithm to maintain the space temperature at the active heating or cooling setpoint. The controller measures the space temperature and active setpoint temperature to determine the unit's heating or cooling capacity (zero to 100 percent).

Occupied/Unoccupied Operation

The occupancy input uses a binary switch (i.e., motion sensor, time clock, etc.) that allows the zone sensor to use its unoccupied internal setpoints.

Random Start

This feature randomly staggers multiple unit start-up to reduce electrical demand spikes.

Warm-up

The two-position fresh air damper option closes during the occupied mode when the space temperature is three degrees or more below the heating setpoint temperature. The damper remains closed during warm-up until the space temperature is within two degrees of the heating setpoint temperature.

Cool-down

The two-position fresh air damper option closes during the occupied mode when the space temperature is three degrees or more above the cooling setpoint temperature. The damper remains closed during cool-down until the space temperature is within two degrees of the cooling setpoint temperature.

Manual Output Test

This function may be initiated from the blue test push button on the controller or through the Tracer® TU service tool. This feature is used to manually exercise the outputs in a defined sequence.

The purpose of this test sequence is to verify output and end device operation. The manual output test function may also be used in the following situations:

- Reset latching diagnostics
- Verify output wiring and operation
- Force the water valve(s) open to balance the hydronic system during installation set-up or service.

Peer-to-Peer Communication

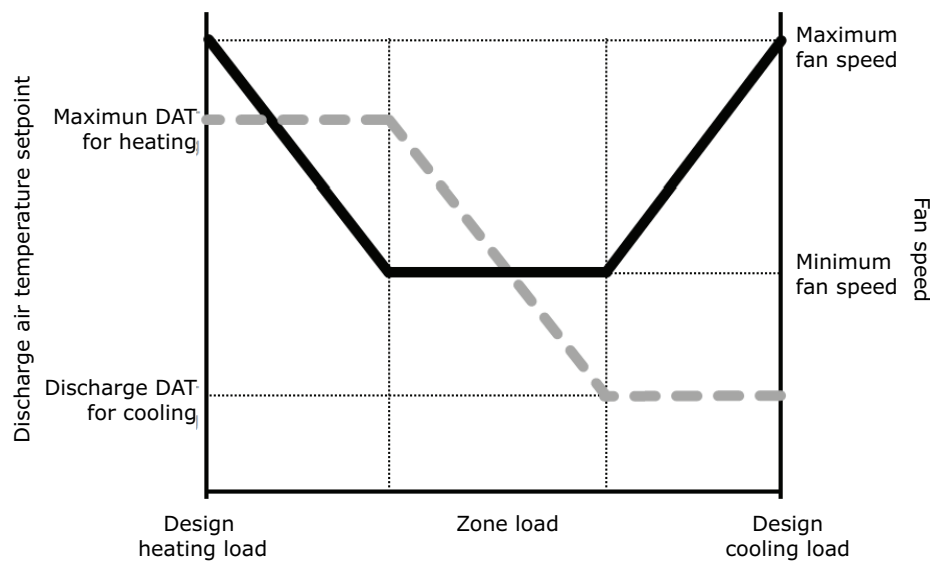

Peer-to-peer communication allows multiple units in one space to share the same zone sensor and provide simultaneous heating and cooling. On the UC400-B/Symbio™ 400-B controller, zone sensor data sharing can be accomplished by use of the BAS system controller.

A thermistor to sense fresh air is factory-mounted at the unit's fresh air opening for use in economizer applications or as a read-only point for Tracer® SC or Tracer® Summit. If the fresh air temperature is a read-only value, it will not impact the control algorithm. In an economizer application, a fresh air temperature signal must be provided either by this thermistor, Tracer SC, or Tracer Summit.

Additional Features

Single-zone VAV control

Figure 12. Single-zone VAV control

Single-zone VAV control varies the speed of the EC fan motor as the zone cooling or heating load changes. When the zone is at design cooling load, the unit operates the fan at maximum speed and cooling capacity is modulated or cycled to deliver the air at the design discharge air temperature (DAT) setpoint for cooling. As the zone cooling load decreases, fan speed is reduced to maintain zone temperature at cooling setpoint, while cooling capacity (and/or economizer) is modulated or cycled to maintain DAT at the same design setpoint. When the fan has reached minimum speed, and the zone cooling load continues to decrease, the fan continues to operate at minimum speed while the DAT setpoint begins to reset upward to maintain zone temperature at cooling setpoint. Cooling capacity (and/or economizer) is modulated or cycled to maintain this DAT setpoint.

When the zone temperature drops to heating setpoint, the fan continues to operate at minimum speed and the DAT setpoint is reset further upward. Heating capacity is modulated or staged to maintain this DAT setpoint. If the zone heating load increases to the point where DAT reaches the maximum limit, fan speed is again increased, while heating capacity is modulated or staged to maintain DAT at this maximum limit.

Automatic Fan and Ventilation Reset

A two-speed fan control for the unit delivers the airflow output customized to support the cfm space needs. When less cfm is necessary to meet the load of the classroom (typically 75 to 80 percent of the time), the equipment operates on low speed. However, if the room temperature rises, the controller will switch to high speed, and the outside air damper will adjust to satisfy the space needs. This helps maintain the proper amount of ventilation air to the occupants independent of the fan speed. As part of the ventilation strategy, the controller will reposition the outside air damper to confirm the minimum outside air cfm is met at both operating conditions.

Filter Maintenance

Filter status for the controller is based on the cumulative run hours of the unit fan. The controller compares the amount of fan run time against an adjustable fan run hour (stored in the controller) to determine when maintenance is recommended for the unit. The run-hours value may be user edited as required (Tracer® TU). The valid range for the fan run hours limit is 0 to 5000 hours with a default of 600 hours. Once the run hours limit has been exceeded, the controller generates a maintenance required diagnostic (unit will not shut-down). The user will be notified of this diagnostic through the building automation system or when a Trane service tool is communicating with the controller.

Active Dehumidification

On units with reheat coils, the controller can provide active dehumidification. This means that the relative humidity in the space can be kept below an adjustable setpoint independent of outdoor weather conditions. Indoor humidity levels are recommended by ASHRAE to be kept below 60 percent in order to minimize microbial growth and the life span of airborne illness causing

Client Server (Data Sharing)

The controller can send or receive data (setpoint, heat/cool mode, fan request, space temperature, etc.) to and from other controllers on the communication link with or without the existence of a building automation system. This applies to applications where multiple units might share one zone sensor for both stand-alone (with communication wiring between units) and a building automation system.

Water Valve Override

The controller can be commanded via the Tracer® TU to open all hydronic valves 100 percent. This allows for the faster water balancing of each unit and the entire system when the command is sent globally to all controllers. A properly balanced system is essential for proper and efficient operation.

Hydronic Coil Freeze Protection (Freeze Avoidance)

Systems in cold climates need to take precautions to avoid hydronic coil freeze-up. The controller does this from three different aspects. Any of these methods of protections will result in the unit fan being disabled, the outside air damper being shut, and the hydronic valves being opened 100 percent.

The three methods of freeze avoidance include:

1. A binary freeze protection thermostat is mounted on the coil and will cause a latching diagnostic if the coil temperature falls below 35°F.
2. An analog discharge air sensor monitors the temperature of the air coming off of the coil and if the temperature falls below 40°F the outside air damper is closed, the fan is turned off and the valves are fully opened.
3. When in the unoccupied mode, the controller has an adjustable freeze avoidance setpoint. If the outside air temperature is below the setpoint, the unit will open the valves to allow water to flow through the coils.

Interoperability

Inter-operability allows the owner freedom to select multiple vendors, and multiple products. With this advantage, the owner can choose the best products, the best application, and the best service from a variety of suppliers to meet their evolving building control needs in a cost effective manner.

Generic Binary Input/Output

The three generic binary inputs/outputs are not part of the normal control, but are actually controlled through the Tracer® SC or Tracer® system (when present) to issue commands to the controller to turn the generic inputs/outputs of add-on equipment (such as baseboard heating, exhaust fans, occupancy

sensors, lighting, etc.) on and off. This binary port is not affected when other binary diagnostics interrupt unit operation.

Tracer® Controls Sequence of Operation

Thermostat

Wall Mounted Thermostat

Auto: Based on the setpoint and room temperature, the fan speed will automatically adjust (low, medium, high).

UC400-B/Symbio™ 400-B

Off: Fan is off; control valve options and mixing box damper options close. The low air temperature detection option is still active.

Auto: Fan speed control in the auto setting allows the modulating control valve option and single or three-speed fan to work cooperatively to meet precise capacity requirements, while minimizing fan speed (motor/energy/acoustics) and valve position (pump energy/chilled water reset). As the capacity requirement increases at low fan speed, the water valve opens. When the low fan speed capacity switch point is reached, the fan switches to the next higher speed and the water valve repositions to maintain an equivalent capacity. The reverse sequence takes place with a decrease in required capacity.

Units with three-speed fans on low, medium, or high: The fan runs continuously at the selected speed and the valve option cycles to meet setpoint.

Air-Fi® Wireless Systems

For more detailed information on Air-Fi Wireless systems and devices, see:

- BAS-SVX40*: *Air-Fi® Wireless System Installation, Operation, and Maintenance*
- BAS-PRD021*-EN: *Air-Fi® Wireless Product Data Sheet*
- BAS-SVX55*: *Air-Fi® Wireless Network Design Installation, Operation, and Maintenance*

Air-Fi Wireless Communications Interface (WCI)

A factory-installed Air-Fi Wireless Communications Interface (WCI) provides wireless communication between the Tracer® SC and unit controllers. The Air-Fi WCI is the perfect alternative to a Trane BACnet® wired communication link. Eliminating the communication wire between terminal products, space sensors, and system controllers has substantial benefits:

- Reduced installation time and associated risks.
- Completion of projects with fewer disruptions.
- Easier and more cost-effective re-configurations, expansions, and upgrades.

Air-Fi Wireless Communications Sensor (WCS)

Communicates wirelessly to a Tracer® unit controller. A WCS is an alternative to a wired sensor when access and routing of communication cable are issues. A WCS allows flexible mounting and relocation.

Zone Sensor Options

A variety of wall-mounted zone sensors are available for design flexibility. Zone sensors have an internal thermistor and operate on 24 Vac. Options with setpoint knobs are available in Fahrenheit or Celsius.

Figure 13. Wall-mounted zone sensor with occupied/unoccupied, COMM (Digit 38 = A)

Figure 14. Wall-mounted zone sensor with setpoint dial, OALMH, occupied/unoccupied, COMM (Digit 38 = C)

Figure 15. Wall-mounted wired display sensor (WDS) with setpoint adjustment, OALMH (Digit 38 = D)

Figure 16. Air-Fi Wireless Communications Sensor (WCS) with setpoint, OALMH (UC400-B/Symbio 400-B only) (Digit 38 = E)

Figure 17. Wall-mounted fan speed switch (Digit 38 = F)

End Device Options

All end device options are factory-installed and -tested.

Table 9. End device option availability

Device	Thermostat	UC400-B/Symbio™ 400-B	CSTI
Condensate float switch	X	X	X
Low limit	X	X	X
Filter run-time diagnostic		X	
Fan status		X	X
2-position control valves	X	X	X
Modulating control valves		X	X
1-stage electric heat	X	X	X
2-stage electric heat		X	X
Frostat™ protection (DX coils)	X	X	X
SCR Electric Heat		X	X

Notes:

1. UC400-B/Symbio 400-B are factory-provided controllers that control the end devices listed in the table.
2. CSTI provides an adapter board with screw down terminals for wiring to end devices for a field-supplied controller.
3. Positive proof fan status switch included with all Trane-controlled units.

Low Temperature Detection

When the low temperature detection device senses an entering air temperature of 36°F to the hydronic coil, the normally-closed switch opens a corresponding set of binary input terminals. The fan disables, control valves open, and the fresh air damper closes when used with a Tracer controller.

The low temperature detection device is an averaging type capillary tube and will reset when it detects an entering air temperature of at least 44°F.

Condensate Overflow Detection

A float switch is factory-supplied for field installation in the auxiliary drain pan to detect a high condensate water level. When the float switch rises, the normally closed input opens a corresponding set of binary input terminals. With Trane controls installed, this also causes the fan to disable, and the control valve and fresh air damper options to close. Although the float switch will close when the high condensate level recedes, the controller must be manually reset before normal unit operation can occur. If using a UC400-B/Symbio™ 400-B controller you can reset using Tracer® SC+. Use Tracer® TU for units with a UC400-B/Symbio 400-B. When wired to the CSTI, the switch does not deenergize the unit when open position occurs.

Important: This is a dry contact only and sequence of operation of unit when this condition is reached is the responsibility of the field provided controller or thermostat.

Outside Air Sensor

Note: Available with Tracer® UC400-B controller only.

The outside air sensor is field-mounted before the upstream of the coil fan to sense the outside air temperature, primarily for use in economizer applications or as a status value when available for other applications.

Discharge Air Sensor

Note: Available with Tracer UC400-B controller only.

The discharge air sensor is factory-mounted on the fan housing downstream of the coils for use as a status point or with other control algorithms. On units with optional electric heat, the sensor is field-mounted in the ductwork, downstream of the unit discharge.

Mixing Box Damper Actuator

Note: Available with UC400-B/Symbio 400-B controller only.

This option is a modulating, NO or NC spring-return damper actuator and is factory-wired and mounted to the mixing box damper assembly. When the controller enables the mixing box damper and the unit is in occupied mode, the damper modulates between its minimum position (configurable) and the full open position to maintain setpoint temperature. If mixing box operation stops or if the unit is in the heating mode, the damper adjusts to its minimum position.

Note: Trane highly recommends using the low temperature detection option with a mixing box damper to detect possible freeze conditions.

CO₂ Sensor for Demand-Controlled Ventilation

Note: Available with UC400-B/Symbio 400-B controller only.

The unit is provided with a CO₂ sensor to enable demand-controlled ventilation (DCV). This sensor provides a 4-20mA signal and ships separate for field installation (wired to UI1). DCV can be used for modulating ECM, single-speed, two-speed, three-speed. It functions during occupied modes (Occupied, Occupied Standby, Occupied Bypass), in either heating or cooling mode, as long as the fan is operating (high, medium, low, On, or Auto). Refer to Tracer® UC400/UC400-B Programmable Controllers for Blower Coil, Fan Coil, and Unit Ventilator Installation, Operation, and Maintenance (BAS-SVX48*-EN) or Symbio™ 400-B/500 Programmable Controllers For Blower Coil, Fan Coil, and Unit Ventilator Installation, Operation, and Maintenance (BAS-SVX093*-EN) for a description of DCV control and guidance in determining the appropriate CO₂ and economizer damper setpoints for a given application.

Humidity Sensor

Note: Available with UC400-B/Symbio 400-B controller only.

The value can be communicated from the Building Automation System via BACnet or the unit can be ordered with a local (wall mounted) RH sensor.

Control Valves

Units with either the control interface or the UC400-B/Symbio™ 400-B controller are available with chilled and/or hot water control valves for each coil configuration. Control valves are available as two way, three way, or pressure independent (PIC) configurations. Valve actuator options include:

- Modulating
- Two-position, normally-open or normally-closed

See the valve availability table for a complete list of available valve options by size.

Two-Position Control Valves

Two-position valve options are spring-return or capacitor discharge-return types. Valves respond to a 24V signal and will either fully open or close. These valves cannot be driven or actuated to a partially open or closed position. If the valve loses power, the valve returns to its de-energized position.

Modulating Control Valves

Modulating control valves offer an alternative for more precise capacity control by modulating or varying the water flow through the coil. The valve responds to a 24V signal from the controller, which determines the valve position by a control algorithm. If the valve loses power, it remains in the position it was in when the power loss occurred.

Pressure Independent Control Valves (PIC)

The PIC valve combines a differential pressure regulator with a 2-way control valve to supply a specific flow regardless of system pressure fluctuations. The valve performs the function of a balancing valve and control valve in one unit.

PIC valves are available with modulating actuators.

Field-Supplied Valves

This option allows the controller to be factory-configured for the normal position of the field supplied valve, as well as running a wiring harness from the control box to the piping side of the unit. When the field-supplied valve option is chosen, the control box is provided with low voltage components and wired back to a terminal strip (CSTI) or controller.

How to Choose the Correct Control Valve

Valve flow coefficient or C_v , is defined as the volume of water flow through a control valve in the fully open position with a 1 psig differential across the valve. Trane Select Assist will default to a program calculated C_v based on individual selections. There is an option for the user to enter their chosen value. It is calculated using the following formula:

$C_v = Q/\text{Square root } \Delta P$ where:

- C_v = flow coefficient
- Q = flow rate (Gpm)
- ΔP = pressure drop across the valve or coil (psig).

Branch authority or β (modulating valves only), which is represented by the following formula:

- $\beta = \text{pressure drop across the valve divided by the pressure drop across the branch circuit} * 100\%$
 $= \Delta P \text{ valve} / \Delta P \text{ branch circuit.}$

* Branch circuit includes the coil and piping package (control valve, circuit setter, ball valves, fittings, and piping) between the supply and return riser.

Note: For good control, β should be between 25 and 70 percent.

Modulating Valve Selection Example

Assume a size 12 Blower Coil is selected to operate at the following conditions:

Entering water temperature = 45°F

Leaving water temperature = 55°F

EAT conditions = 80/67.

The coil is selected as a four-row coil.

Select the best modulating valve size for this unit.

1. Find the ΔP across the water coil. Refer to the AHRI performance table to determine the ΔP across the water coil (or use Trane Select Assist™ selection program). The water pressure drop is found to be 2.00 of water at a flow rate of 2.67 gpm. This converts to a pressure drop of 0.87 psig (1.0 feet of water = 0.4328 psig.)
2. Calculate the C_v of the water coil.

Controls

$Cv = Gpm / \text{Square root } \Delta P$

$Cv = 2.67 / \text{Square root } 0.87$

$Cv = 2.86$

Therefore, the valve with the Cv of 3.3 should be selected since it has the Cv which is closest to the Cv of the water coil.

Table 10. Valve availability

Option		A 2-way, 2-position, N.C.	B 2-way, 2-position, N.O.	C 3-way, 2-position, N.C.	D 3-way, 2-position, N.O.	E 2-way, modulating	F 3-way, modulating

Electrical Data

Minimum Circuit Ampacity (MCA) and Maximum Fuse Size (MFS) Calculations for Non-Electric Heat Units

MCA = 1.25 x motor FLAs

MFS or HACR type circuit breaker = 2.25 x motor FLA

Minimum Circuit Ampacity (MCA) and Maximum Fuse Size (MFS) Calculations for Units with Electric Heat

Heater amps = (heater kW x 1000) / heater voltage

Notes:

- Use 120V heater voltage for 115V units.
- Use 240V heater voltage for 230V units.
- Use 208V heater voltage for 208V units.
- Use 277V heater voltage for 277V units.
- Use 480V heater voltage for 460V units.
- Use 600V heater voltage for 575V units.

MCA = 1.25 x (heater amps + all motor FLAs) MFS or HACR type circuit breaker = (2.25 x motor FLA) + heater amps

HACR (Heating, Air-Conditioning, and Refrigeration) type circuit breakers are required in the branch circuit wiring for all units with electric heat.

Select a standard fuse size equal to the calculated MFS. Use the next smaller size if the calculated MFS does not equal a standard size.

Standard fuse sizes: 15, 20, 25, 30, 35, 40, 45, 50, 60 amps.

Useful Formulas

- kW = (cfm x ΔT) / 3145
- ΔT = (kW x 3145) / airflow
- Single phase amps = (kW x 1000) / voltage
- Electric heat MBh = (Heater kW) (3.413)
- Three-phase amps = (kW x 1000)/(voltage x 1.73)

Table 11. Available motor horsepower

Motor	Unit Voltage	Motor Horse Power						
		0.5	1.0	1.5	2.3	3.0	3.5	5.0

Mechanical Specifications

General

The product line consists of horizontal and vertical air handling units and mixing boxes. Units are tested and certified with AHRI 430 and tested in accordance with AHRI 260. The unit is UL listed to U.S. and Canadian safety standards.

Air handlers consist of a hydronic and/or DX coil, drain pan, and centrifugal fan with motor mounted in a common cabinet. Coil connections are independent for the same or opposite side location.

Horizontal air handlers are provided with knockouts in all four corners for installing the unit suspended from the ceiling with threaded rods.

Unit and accessories are insulated with 1-inch, 1-1/2 lb/ft³ density fiberglass insulation. One-inch foil-faced and one-inch double wall insulation are also available.

Large motor access panels are provided on both sides of the unit and accessories for vertical models BCVE 72-120, and one side of horizontal model BCHE. Vertical models BCVE size 72-120 ship in two pieces.

Casings

Casings (structural components) are constructed of heavy-gauge galvanized steel, insulated with one-inch, 1-1/2 lb density fiberglass fire resistant and odorless glass fiber material to provide thermal and acoustical insulation. Fan housing sides are directly attached to the air handler top and bottom panels strengthening the entire unit assembly. Coil access panels are located on the sides of BCHE/BCVE size 72-120 air handlers and allow easy removal of the internal coils and drain pan. Coil access is located on the front of the BCVE size 24-60 model. Main access panels provide generous access to the fan and motor from the side of the BCHE/BCVE size 72-120 air handler, and the front of the BCVE size 24-60 unit.

Coils

Hydronic Coils

Cooling coils are four-, six-, or eight-row chilled water. Heating coils are one- or two-row hot water. Heating coils are available factory-installed in the preheat or reheat position. All hydronic coils are 12 fins per inch, with 0.012 inch wall thickness. All hydronic coils use highly efficient aluminum fins, mechanically bonded to seamless copper tubes. All coils are specifically designed and circuited for water use. All coils are factory tested with 450 psi air under water. Maximum standard operating conditions are: 300 psig, 200°F. Sweat type connections are standard. Coil performance data is in accordance with the current edition of AHRI Standard 410.

Direct Expansion (DX) Coils

DX coils use refrigerant 410A, have 3/8-inch OD internally grooved, round seamless copper tubes expanded into full fin collars for permanent fin-tube bond. Three-, four-, and six-row DX coils use highly efficient aluminum fins mechanically bonded to stainless copper tubes with 12 fins per inch fin spacing.

The coil casing is 16-gauge galvanized steel. A foam sealing strip between the casing (top and bottom) channels and fins helps eliminate air bypass and reduce potential water carryover. Coils have round, seamless, copper pipe liquid lines and suction headers with male sweat connections. Suction headers have bottom connections to aid drainage of any oil that may collect in the coil. Liquid line and suction connections are outside the unit casing (on the same side of the unit) to facilitate field piping. Connections are clearly labeled to ensure coils are piped correctly. Coils have a venturi-type distributor assembly designed with a vertical downflow feed for low pressure drops.

Coils are proof tested at 715 psig and leak tested at 650 psig air-under-water. Coils are dehydrated and sealed with a dry air charge. Maximum standard operating conditions are 650 psig at 127°F with R-410A. Coil performance data is in accordance with the current edition of AHRI Standard 410.

Mechanical Specifications

Fan

The fans are DWDI (double width double inlet) forward curved centrifugal blower type. The fans are direct drive mounted directly to the motor shaft. All fans are dynamically balanced. All air handlers have a single fan.

EC Motors

A 50/60 Hertz, variable speed, multiple voltage EC motor has a plus or minus 10 percent voltage utilization range. The motor is open type with permanently sealed ball bearings, internal overload protection, and uses a radial mount. The motor is factory installed, programmed, and wired to the air handler control panel.

All motors are brushless DC (BLDC)/electronically commutated motors (ECM) factory programmed and run-tested in assembled units. The motor controller is mounted in a touch-safe control box with a built-in integrated user interface and LED tachometer. If adjustments are needed, motor parameters can be adjusted through momentary contact switches on the motor control board accessible without factory service personnel.

Motors will soft-ramp between speeds to lessen the acoustics due to sudden speed changes. Motors can be operated at single speed, three speeds or with single zone VAV control. The motor will choose the highest speed if there are simultaneous/conflicting speed requests.

All motors have integral thermal overload protection and are permanently lubricated. BCHE/BCVE single-phase motors have a maximum ambient operating temperature of 104°F and three-phase motors have a maximum ambient operating temperature of 130°F. Motors are capable of operating at 90 percent of rated voltage on all speed settings. Motors can operate up to 10 percent over voltage.

Drain Pan

The drain pan is noncorrosive and double-sloped to allow condensate drainage. The drain pan construction is polymer or optional stainless steel. Coils mount above the drain pan—not in the drain pan—thus allowing the drain pan to be fully inspected and cleaned. The drain pan can also be removed for cleaning. The polymer drain pan connections are unthreaded 3/4-inch schedule 40 PVC for solvent bonding. The stainless steel drain pan connection is 3/4-inch NPT schedule 40 stainless steel pipe. The main drain connection is at the lowest point of the drain pan. An auxiliary drain connection is provided on the same side as the main connection for BCHE and BCVE 72-120. BCVE size 24-60 utilizes a rubber hose for an internal trap. A 3/4-inch schedule 40 PVC can connect to the internal trap with the provided hose clamp.

Filters

One-inch standard efficiency throwaway, two-inch MERV 8, and two-inch MERV 13 are available on all Blower Coil units. Units have a standard flat filter rack that is sized for less than 600 feet per minute at nominal airflow. An optional angle filter rack is available; this is sized for less than 300 feet per minute at nominal airflow. All units and filter racks use standard filter sizes.

Mixing Box

Mixing boxes are constructed of galvanized steel and can be ordered with single or double wall panels. They have two low-leak parallel blade dampers that are factory-linked together. Mixing boxes also include two side access panels as standard to provide access to filters and the damper actuator.

Electric Heater

The heater is a UL recognized resistance open-wire heater with disc-type automatic and manual reset-type thermal safety devices. The electric heater is factory-mounted and an air handler with this heater is a UL/CUL product. One stage, two stage, or SCR modulating control options are available. A single-point power connection to the unit is provided. Optional heater fuses, and a heater door interlocking disconnect switch are available.

Controls

Controls options are: CSTI, thermostat, and UC400-B/Symbio™ 400-B. A variety of inputs and outputs are available for the CSTI and Tracer controller options. A disconnect switch (for nonelectric heat units), fused transformer, contactor(s), and terminal strip are provided with the control interface and Tracer controller options

Customer Supplied Terminal Interface (CSTI)

The control interface is intended to be used with a field-supplied, low-voltage thermostat or controller. The control box contains a line voltage to 24-volt transformer and a disconnect switch on non-electric heat units.

Thermostat

The low voltage, wall mounted thermostat is available factory or field installed. Thermostat control is available with 2 position valves, 2 position damper actuators, low limit protection, and condensate overflow protection. The thermostat is capable of controlling cooling (hydronic or DX), heating (hydronic and electric heat), and automatic changeover all with continuous fan or thermostat controlled fan speeds

UC400-B/Symbio™ 400-B

The UC400-B/Symbio 400-B controller delivers single zone VAV control in a stand-alone application or as part of a building automation system with BACnet® communication. The UC400- B/Symbio 400-B ships with unit of measure over BACnet link in SI units. When a BAS system is unable to convert to other desired units a free software tool is available for changing to other unit of measure. The UC400-B/ Symbio 400-B offers the combined advantages of a factory mounted, wired and programmed controller for dependable out-of-the box operation. Standard control features include options normally available on more elaborate control systems. All control options are available factory programmed with additional configuration and programming in the field using a service tool.

Air-Fi® Wireless Comm Interface (WCI)

The Wireless Communications Interface (WCI) enables wireless communications between system controls, unit controls, and wireless sensors for Air-Fi control products that use the BACnet protocol. The WCI replaces the need for communications wire in all system applications.

Valve Kits

Control valves are included in all factory valve kits. Kits do not include interconnecting copper tubing. Kits come in a variety of control valve options:

- Two- or Three-way
- 1/2-in, 3/4-in, 1-in, or 1 1/4-in.
- Two-position or Modulating Control
- Pressure Independent Control (PIC)

Two Position Control Valves

Two position control valves are ball valve design with zero leakage. The ball valve incorporates self-cleaning technology to provide superior clog resistance. The actuator is easily removable for service without removing the valve body.

Control valves with a Cv of 2.3 to 4.6 are capacitor discharge return. Valves with a Cv of 7.4 and 10.0 are spring return.

Modulating Control Valves

Modulating control valves are ball valve design with zero leakage. The ball valve incorporates self cleaning technology to provide superior clog resistance. The actuator is easily removable for service without removing the valve body. The actuator is easily removable for service without removing the valve body. Actuators are fail in place.

Figure 38. Control valve

End Valves

Each valve kit includes a ball valve for the entering water pipe and one of the following end valves on the leaving water pipe: ball valve or manual circuit setter.

Ball Valve

The ball valve is manual shutoff with a maximum working pressure of 600 psig. The valve handle rotates 90° to a fully open position.

Manual Circuit Setter

The manual circuit setter acts as both a flow setting device and a stop valve. The manual circuit setter includes 1/4-in. Schrader ports in the valve body to measure pressure drop across the valve. The working pressure of the valve is 300 psig with a maximum water temperature of 250° F.

Figure 41. Manual circuit setter

Strainer

The strainer is provided with a plug to access the basket. The strainer contains a 20 mesh screen with a working pressure of 300 psig and a maximum water temperature of 210° F.

Bypass Balance Valve

All three-way control valve packages include a balance fitting in the bypass line to allow flow balancing in the bypass position. The balance valve incorporates both a brass gland screw and stem for manual flow adjustment. The working pressure of this valve is 400 psig.
