A SAFETY WARNING

Only qualified personnel should install and service the equipment. The installation, starting up, and servicing of heating, ventilating, and air-conditioning equipment can be hazardous and requires specific knowledge and training. Improperly installed, adjusted or altered equipment by an unqualified person could result in death or serious injury. When working on the equipment, observe all precautions in the literature and on the tags, stickers, and labels that are attached to the equipment.

Introduction

Read this manual thoroughly before operating or servicing this unit.

This document is customer property and is to remain with this unit. Return to the service information pack upon completion of work.

Warnings, Cautions, and Notices

Safety advisories appear throughout this manual as required. Your personal safety and the proper operation of this machine depend upon the strict observance of these precautions.

The three types of advisories are defined as follows:

Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury. It could also be used to alert against unsafe practices.

Indicates a situation that could result in equipment or property-damage only accidents.

A WARNING

Proper Field Wiring and Grounding Required!

Failure to follow code could result in death or serious injury.

All field wiring MUST be performed by qualified personnel. Improperly installed and grounded field wiring poses FIRE and ELECTROCUTION hazards. To avoid these hazards, you MUST follow requirements for field wiring installation and grounding as described in NEC and your local/state/national electrical codes.

A WARNING

Personal Protective Equipment (PPE) Required!

Failure to wear proper PPE for the job being undertaken could result in death or serious injury. Technicians, in order to protect themselves from potential electrical, mechanical, and chemical hazards, MUST follow precautions in this manual and on the tags, stickers, and labels, as well as the instructions below:

- Before installing/servicing this unit, technicians MUST put on all PPE required for the work being undertaken (Examples; cut resistant gloves/ sleeves, butyl gloves, safety glasses, hard hat/ bump cap, fall protection, electrical PPE and arc flash clothing). ALWAYS refer to appropriate Safety Data Sheets (SDS) and OSHA guidelines for proper PPE.
- When working with or around hazardous chemicals, ALWAYS refer to the appropriate SDS and OSHA/GHS (Global Harmonized System of Classification and Labelling of Chemicals) guidelines for information on allowable personal exposure levels, proper respiratory protection and handling instructions.
- If there is a risk of energized electrical contact, arc, or flash, technicians MUST put on all PPE in accordance with OSHA, NFPA 70E, or other country-specific requirements for arc flash protection, PRIOR to servicing the unit. NEVER PERFORM ANY SWITCHING, DISCONNECTING, OR VOLTAGE TESTING WITHOUT PROPER ELECTRICAL PPE AND ARC FLASH CLOTHING. ENSURE ELECTRICAL METERS AND EQUIPMENT ARE PROPERLY RATED FOR INTENDED VOLTAGE.

©2025 FNR-SVX003A-EN

A WARNING

Follow EHS Policies!

Failure to follow instructions below could result in death or serious injury.

- All Trane personnel must follow the Environmental, Health and Safety (EHS) policies when performing work such as hot work, electrical, fall protection, and lockout/tagout. Where local regulations are more stringent than these policies, those regulations supersede these policies.
- Non-Trane personnel should always follow local regulations.

A WARNING

Cancer and Reproductive Harm!

This product can expose you to chemicals, including lead, which are known to the State of California to cause cancer and birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov.

A WARNING

Safety Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

This unit is not to be used by persons (including children) with reduced physical, sensory, or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning the use of the appliance by a person responsible for their safety.

Do not allow children to play or climb on the unit or to clean or maintain the unit without supervision.

A WARNING

Fire Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

For installations with flammable refrigeration system, the furnace must be powered at all times except during servicing. The furnace must be installed and connected according to installation instructions and wiring diagrams provided with the evaporator coil.

A WARNING

Fire or Explosion Hazard!

Failure to follow safety warnings exactly could result in a fire or explosion causing property damage, personal injury or loss of life.

Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance. WHAT TO DO IF YOU SMELL GAS:

- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions. If you cannot reach your gas supplier, call the fire department.
- Installation and service must be performed by a qualified installer, service agency, or the gas supplier.

A WARNING

Explosion Hazard!

Failure to follow instruction below could result in death or serious injury or property damage. Install a gas detector for leak warnings. The manufacturer does not test or endorse any specific brand or type of detector.

A WARNING

Fire or Explosion Hazard!

Failure to follow safety warnings exactly could result in serious injury, death, or or property damage.

Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections. A fire or explosion can result causing property damage, personal injury, or loss of life.

A WARNING

Electrical Shock, Fire, or Explosion Hazard!

Failure to follow the safety warnings exactly could result in dangerous operation, serious injury, death, or property damage.

Improper servicing could result in dangerous operation, serious injury, death, or property damage.

- Before servicing, disconnect all electrical power to the furnace.
- When servicing controls, label all wires prior to disconnecting. Reconnect wires correctly.
- · Verify proper operation after servicing.

A WARNING

Carbon Monoxide Poisoning!

Failure to follow instructions below could result in death or serious injury, or property damage.

- To confirm the furnace is vented properly, do not replace factory-supplied venting components with field fabricated parts. Fabricating parts can result in damaged vents and components, allowing carbon monoxide to escape the venting system.
- Follow the service and/or periodic maintenance and installation and operation instructions for the furnace and the venting system. Do not attempt to change the venting system.
- Verify the blower door is in place and not ajar.
 Dangerous fumes could escape an improperly secured door.
- Inspect the chimney liner thoroughly to verify no cracks or other potential areas for flue gas leaks are present in the liner. Liner leaks will result in early damage to the chimney. Furnace venting into an unlined masonry chimney or concrete chimney is prohibited.

A WARNING

Carbon Monoxide Poisoning!

Failure to follow instructions below could result in death or serious injury, and property damage.

When replacing a furnace, confirm the venting system is adequate for the new furnace.

WARNING

Fire Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

Do not install the furnace directly on carpet, tile, or other combustible material other than wood flooring. Use subbase (BAYBASE205) between the furnace and combustible flooring for vertical downflow applications. When the downflow furnace is installed vertically with a cased coil, a subbase is not required.

A WARNING

Explosion Hazard!

4

Failure to follow instruction below could result in death or serious injury or property damage.

Propane gas is heavier than air and can accumulate in low areas or confined spaces. Odorant fade may make it undetectable without a warning device. If a gas furnace is installed in a basement, excavated areas, or a confined space, it is strongly recommended to contact a gas supplier to install a gas detector for leak warnings. The manufacturer does not test or endorse any specific brand or type of detector.

A WARNING

Electrical Shock Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

Do not bypass the door switch or the panel loop permanently.

A WARNING

Electrical Shock Hazard!

Failure to follow instructions below could result in death or serious injury or property damage..

Do not touch any components other than the Menu and Option buttons on IFC when setting up the system or during fault code recovery.

A WARNING

Risk of Fire or Explosion!

Failure to follow instruction below could result in death or serious injury or property damage.

Do NOT attempt to manually light the furnace.

A WARNING

Electrical Shock Hazard!

Failure to follow instructions below could result in death or serious injury or property damage. Disconnect power to the unit before removing the blower door and wait at least 10 seconds for the IFC power supply to discharge to 0 volts.

A WARNING

Safety Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

Do not install these furnaces in manufactured housing (mobile), trailers, or recreational vehicles.

A WARNING

Explosion Hazard!

Failure to follow instruction below could result in death or serious injury or property damage. If electrical, fuel, or mechanical failures occur, shut off the gas supply at the manual valve on the supply piping before turning off the furnace's electrical power. Contact your dealer's designated service agency.

A WARNING

Safety Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

Do not use semi-rigid metallic gas connectors (flexible gas lines) within the furnace cabinet.

A WARNING

High Voltage Moving Parts!

Failure to follow instructions below could result in death or serious injury or property damage due to high voltage electrical components, fast-moving fans, and combustible gas.

During installation and servicing, turn off the main gas valve and disconnect the electrical supply. If operating checks must be performed with the unit operating, the technician must recognize these hazards and proceed safely.

A WARNING

Safety Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

Do not install the filter in the return duct directly above the furnace in horizontal applications. Install the filter remotely.

A WARNING

Safety Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

Turn off the power to the furnace before servicing

filters to avoid contact with moving parts.

A WARNING

Shock Hazard!

Failure to follow instructions below could result in death or serious injury or property damage. If a disconnect switch is present, always lock in the open position before servicing the unit.

A WARNING

Overheating and Explosion Hazard!

Failure to follow this warning could result in property damage, personal injury, or death.

Should the gas supply fail to shut off or if overheating occurs, shut off the gas valve to the furnace before shutting off the electrical supply.

A WARNING

Hot Surface!

Failure to follow instructions below could result in minor to moderate injuries.

Do not touch igniter. It is extremely hot.

A WARNING

Carbon Monoxide Poisoning Hazard!

Failure to follow the steps outlined below for each appliance connected to the venting system being placed into operation could result in carbon monoxide poisoning or death.

The following steps shall be followed for each appliance connected to the venting system being placed into operation, while all other appliances connected to the venting system are not in operation:

- Seal any unused openings in the venting system.
- Inspect the venting system for proper size and horizontal pitch as required in the National Fuel Gas Code, ANSI Z223.1/NFPA 54 or the Natural Gas and Propane Installation Code, CSA B149.1 and these instructions. Determine there is no blockage or restriction, leakage, corrosion, or other deficiencies which could cause an unsafe condition.
- As far as practical, close all building doors and windows and all doors between the space in which the appliance(s) connected to the venting system are located and other spaces of the building.
- Close fireplace dampers.
- Turn on clothes dryers and any appliance not connected to the venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they are operating at maximum speed. Do not operate a summer exhaust fan.
- Follow the lighting instructions. Place the appliance being inspected into operation. Adjust the thermostat so appliance is operating continuously.
- Test for spillage from draft hood equipped appliances at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle.
- If improper venting is observed during any of the above tests, correct the venting system in accordance with the National Fuel Gas Code, ANSI Z223.1/NFPA and/or Natural Gas and Propane Installation Code, CSA B149.1.
- After it has been determined that each appliance connected to the venting system properly vents when tested as outlined above, return doors, windows, exhaust fans, fireplace dampers, and any other gasfired burning appliance to their previous conditions of use.

A CAUTION

Improper Voltage Connection!

Failure to follow instructions below could result in personal injury or equipment damage.

Do NOT connect the furnace line voltage to a GFCI-protected circuit.

A CAUTION

Corrosion Hazard!

Failure to follow instructions below could result in minor to moderate injury or property damage.

Do not install the furnace in a corrosive or contaminated atmosphere.

A CAUTION

Sharp Edges!

Failure to follow instructions below could result in minor to moderate injury.

The service procedure described in this document involves working around sharp edges. To avoid being cut, technicians MUST put on all necessary Personal Protective Equipment (PPE), including gloves and arm guards.

A CAUTION

Valve Damage!

Failure to follow instructions below could result in minor to moderate injury or equipment damage.

Use a backup wrench on the gas valve when installing gas piping to prevent damage to the valve and manifold assembly.

CAUTION

Freeze Damage!

Failure to follow instructions below could result in minor to moderate injury or property damage. During complete furnace shutdown during cold weather, take measures to prevent water pipes and receptacles from freezing.

A CAUTION

Freeze Damage!

Failure to follow instructions below could result in minor to moderate injury or property damage. Schedule a qualified personnel to inspect the temperature if a house is vacant during freezing weather. If your furnace fails to operate, it could lead to frozen water pipes.

A CAUTION

Ignition Function!

Failure to follow instructions below could result in minor to severe injury and result in poor ignition characteristics.

Maintain manifold pressure in high altitude installations.

A CAUTION

Water Damage!

Failure to follow instructions below could result in minor to moderate injury or property damage. Install an external overflow drain pan in all applications over a finished ceiling to prevent leaking condensate.

A CAUTION

FURNACE SERVICE CAUTION!

Failure to follow instructions below could result in property damage or personal injury.

Label all wires prior to disconnection when servicing controls. Verify proper operation after servicing. Wiring errors can cause improper and dangerous operation.

A CAUTION

Do NOT Use as Construction Heater!

Failure to follow instructions below could result in property damage or personal injury.

To prevent shortening its service life, do not use the furnace as a construction heater during the finishing phases of construction until the furnace installation guidelines are met. Condensate in the presence of chlorides and fluorides from paint, varnish, stains, adhesives, cleaning compounds, and cement, create a corrosive condition which may cause rapid deterioration of the heat exchanger.

A CAUTION

Wiring Hazard!

Failure to follow instructions below could result in minor to moderate injury or property damage.

The integrated furnace control is polarity sensitive.

Connect the hot leg of the 120 VAC power to the black field lead.

NOTICE

Equipment Damage!

Failure to follow instructions below could result in equipment damage.

UV light exposure can deteriorate plastic blower material, potentially damaging the blower housing. For units with plastic blower housings, do not install third-party UV air cleaners where the blower housing is exposed to UV light.

General Information

The Diagnostics Mobile App is available by scanning a QR code located inside this unit or by searching for the Link Diagnostics App in your App Store.

When using the Link Communicating protocol, the furnace must be used with A/T HUI2360A200U thermostat and TSYS2C60A2VVU* System Controller.

Furnace Installation Guidelines

The following sections give general guidelines for the installation of the gas furnaces.

Safety Practices and Precautions

The following safety practices and precautions must be followed during the installation, servicing, and operation of this Furnace.

- 1. Use only with the type gas approved for this Furnace. See the Furnace rating plate.
- Install the Furnace only in a location and position as specified in "Locations and Clearances," p. 14 of these instructions.
- 3. Provide adequate combustion and ventilation air to the Furnace space as specified in "Air for Combustion and Ventilation," p. 35 of these instructions.
- Combustion products must be discharged outdoors.
 Connect this Furnace to an approved vent system only, as specified in the "General Venting," p. 34 section of these instructions.
- Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections, as specified in the "," section of these instructions.
- 6. Always install the Furnace to operate within the Furnace's intended temperature-rise range with a duct system which has an external static pressure within the allowable range, as specified on the unit rating plate. Airflow within temperature rise for cfm versus static is shown in the Airflow Tables section of these instructions.
- 7. When a Furnace is installed so that the supply ducts carry air circulated by the Furnace to areas outside the space containing the Furnace, the return air shall also be handled by a duct(s) sealed to the Furnace casing and terminating outside the space containing the Furnace.
- A gas-fired Furnace for installation in a residential garage must be installed as specified in "Locations and Clearances," p. 14 of these instructions.
- 9. The furnace may be used for temporary heating of buildings or structures under construction only when the following conditions have been met:
 - a. The Furnace venting system must be complete and installed per manufacturer's instructions.
 - b. The Furnace is controlled only by a room Comfort Control (no field jumpers).
 - The Furnace return air duct must be complete and sealed to the Furnace.
 - d. The Furnace input rate and temperature rise must be verified to be within the nameplate marking.

- e. A minimum 4-inch MERV 11 air filter must be in place.
- f. 100% of the Furnace combustion air requirement must come from outside the structure.
- g. The Furnace return air temperature range is between 55 and 80 Fahrenheit.

80% models = 55°F

90%+ models = 45°F

- Clean the Furnace, duct work, and components upon substantial completion of the construction process, and verify Furnace operating conditions including ignition, input rate, temperature rise, and venting, according to the manufacturer's instructions.
- In the Commonwealth of Massachusetts, this product must be gas piped by a Licensed Plumber or Gas Fitter.

This Furnace is certified to leak 1% or less of nominal air conditioning CFM delivered when pressurized to .5-inch water column with all inlets, outlets, and drains sealed.

General Guidelines

The manufacturer assumes no responsibility for equipment installed in violation of any code or regulation.

It is recommended that Manual J of the Air Conditioning Contractors Association (ACCA) or A.R.I. 230 be followed in estimating heating requirements. When estimating heating requirements for installation at Altitudes above 2000 ft., remember the gas input must be reduced. See Combustion and Input Check.

Material in this shipment has been inspected at the factory and released to the transportation agency without known damage. Inspect exterior of carton for evidence of rough handling in shipment. Unpack carefully after moving equipment to approximate location. If damage to contents is found, report the damage immediately to the delivering agency.

Codes and local utility requirements governing the installation of gas fired equipment, wiring, plumbing, and flue connections must be adhered to. In the absence of local codes, the installation must conform with latest edition of the National Fuel Gas Code ANSI Z223.1 / NFPA 54. The latest code may be obtained from the American Gas Association Laboratories, 400 N. Capitol St. NW, Washington D.C. 20001. 202-824-7000 or www.aga.org.

These furnaces have been classified as Fan Assisted Combustion system category I furnaces as required by ANSI Z21.47 "latest edition". Therefore they do not require any special provisions for venting other than what is indicated in these instructions.

Warning: These furnaces are not approved or intended for installation in manufactured (mobile) housing, trailers, or recreational vehicles.

Locations and Clearances

The location of the Furnace is normally selected by the architect, the builder, or the installer. However, before the Furnace is moved into place, be sure to consider the following requirements:

- 1. Is the location selected as near the chimney or vent and as centralized for heat distribution as practical?
- Do all clearances between the Furnace and enclosure equal or exceed the minimums stated in Clearance Table below?

Installation Clearance to Combustible Construction

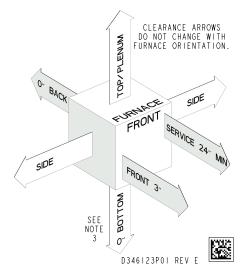

This furnace is approved for upflow, downflow and horizontal applications.

Table 5. Locations and clearances

Minimum clearance to combustible materials										
Vertical Applications										
Furnace Cabinet Clearance Sides Clearance Top Size (in.) (in.) (in.)										
14.5 cabinets, all BTU	1									
17.5 cabinets, all BTU	0	1								
21.0 cabinets, all BTU	0	1								
24.5 cabinets, all BTU	0	1								
	Horizontal Applications									
14.5 cabinets, all BTU	1	2								
17.5 cabinets, all BTU	1	2								
21.0 cabinets, all BTU	1	3								
24.5 cabinets, all BTU	1	5								

Figure 1. Locations and clearances

CLEARANCE IN INCHES.

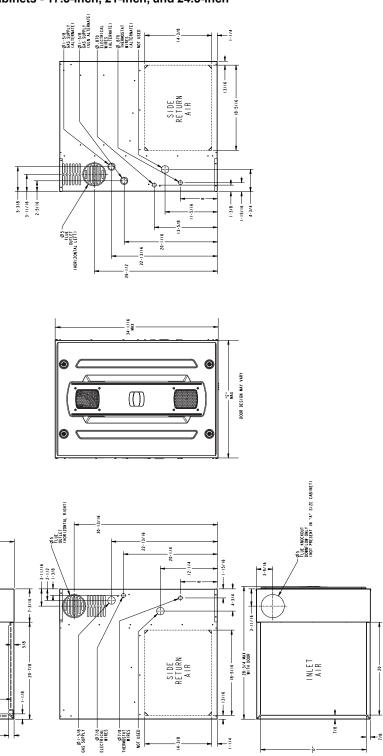

- Is there sufficient space for servicing the Furnace and other equipment? A minimum of 24 inches front accessibility to the Furnace must be provided. Any access door or panel must permit removal of the largest component.
- 4. Are there at least 3 inches of clearance between the Furnace combustion air openings in the front panel and any closed panel or door provided?
- 5. Are the ventilation and combustion air openings large enough and will they remain unobstructed? If outside air is used, are the openings set 12-inch above the highest snow accumulation level?
- Allow sufficient height in supply plenum above the Furnace to provide for cooling coil installation, if the cooling coil is not installed at the time of this Furnace installation.
- 7. The Furnace shall be installed so electrical components are protected from water.
- 8. A vertical downflow furnace without a coil, must use BAYBASE205 when installed on combustible flooring.
- If the Furnace is installed in a garage, it must be installed so that the burners, and the ignition source are located not less than 18 inches above the floor and the Furnace must be located or protected to avoid physical damage from vehicles.
- 10. The gas furnace must not be located where excessive exposure to contaminated combustion air will result in safety and performance related problems. Avoid the following known contaminants:
 - a. Permanent wave solutions
 - b. Chlorinated waxes and cleaners
 - c. Chlorine based swimming pool chemicals
 - d. Water softening chemicals
 - e. De-icing salts or chemicals
 - f. Carbon tetrachloride
 - g. Halogen type refrigerants
 - h. Cleaning solvents (such as perchloroethylene)
 - i. Printing inks, paint removers, varnishes, etc.
 - j. Hydrochloric acid
 - k. Cements and glues
 - Antistatic fabric softeners for clothes dryers
 - m. Masonry acid washing materials

Furnace General Installation

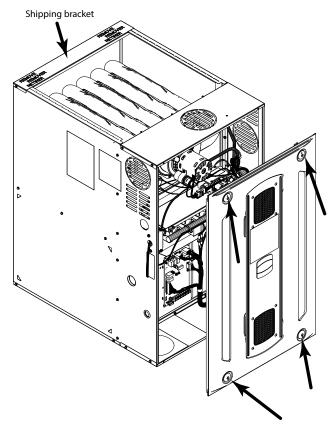

The following sections give general instructions for the installation of the gas furnaces.

S-Series Furnace Panel Removal

Notes:

- For the S8V2 furnace, a 5/16-inch. Allen wrench is required to remove the four latches on the front panel.
- 2. Remove the shipping bracket before installation.

Figure 5. Furnace panel removal

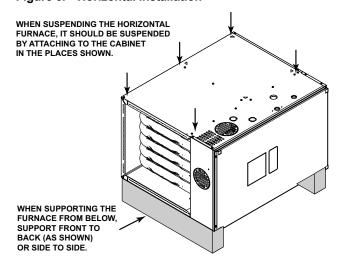

Horizontal Installation in an Attic or Crawlspace

The non-condensing furnace may be installed in an attic or crawl space in the horizontal position by placing the furnace on its left or right side (as viewed from the front in the vertical position). The horizontal furnace installation in an attic should be on a service platform large enough to allow for proper clearances on all sides and service access to the front of the furnace. See the "Locations and Clearances," p. 14. Line contact is only permissible between lines formed by intersections of the top and two sides of the furnace casing and building joists, studs, or framing.

The furnace may be placed horizontally in a crawl space on a pad or other noncombustible material. Place blocks underneath to support the furnace and raise the unit for sufficient protection from moisture.

The furnace may be installed in a hanging position using straps. The furnace should be supported at both ends and have an additional support in the center of the furnace in back.

Figure 6. Horizontal installation

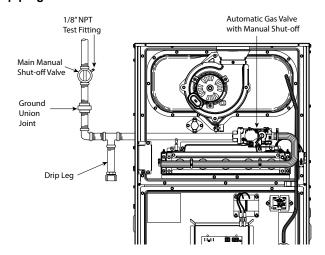

Gas Piping

Important: The furnace default is left side gas piping.

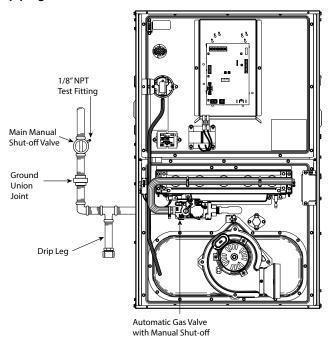

Note: For ease of installation, optional accessory part PIP02095 is recommended for gas piping entering the right side of the furnace.

Figure 7. Furnace in upflow orientation with gas piping on left

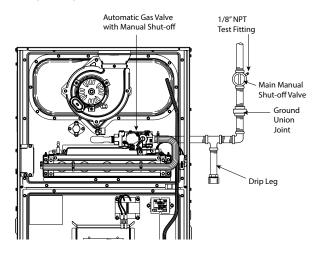

Note: For ease of installation, optional accessory part PIP02095 is recommended for gas piping entering the left side of the furnace in the downflow orientation.

Figure 8. Furnace in downflow orientation with gas piping on left

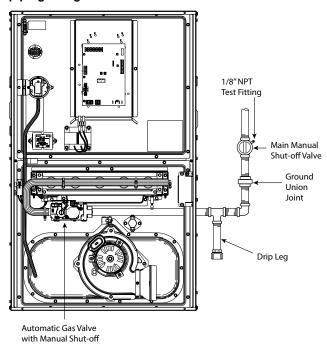

Note: For ease of installation, optional accessory part PIP02095 is recommended for gas piping entering the right side of the furnace in the upflow orientation.

Figure 9. Furnace in upflow orientation with gas piping on right

Note: For ease of installation, optional accessory part PIP02095 is recommended for gas piping entering the right side of the furnace.

Figure 10. Furnace in downflow orientation with gas piping on right

Note: For ease of installation, optional accessory part PIP02095 is recommended for gas piping entering the top of the furnace in the horizontal left position.

Figure 11. Furnace in horizontal left orientation with gas piping out top

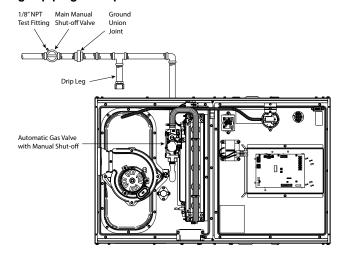

Figure 12. Furnace in horizontal right orientation with gas piping out top

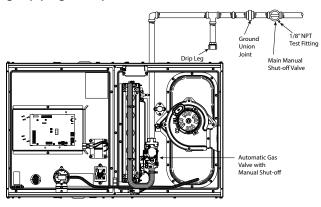

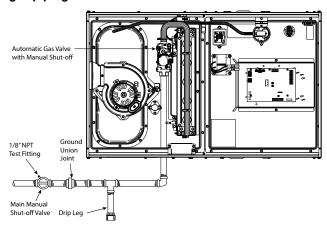

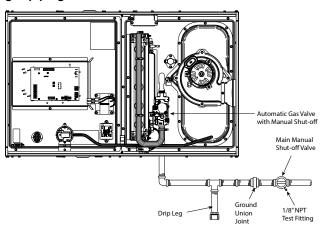

Figure 13. Furnace in horizontal left orientation with gas piping out bottom

Note: For ease of installation, optional accessory part PIP02095 is recommended for gas piping entering the bottom of the furnace in the horizontal right position.

Figure 14. Furnace in horizontal right orientation with gas piping out bottom

The furnace is shipped standard for left side installation of gas piping. A cutout with plug is provided on the right side for an alternate gas piping arrangement.

The installation of piping shall be in accordance with piping codes and the regulations of the local gas company. Pipe joint compound must be resistant to the chemical reaction with liquefied petroleum gases.

Important: If local codes allow the use of flexible gas appliance connector, always use a new listed connector. Do not use a connector which has previously serviced another gas appliance.

See the piping table for delivery sizes. Connect gas supply to the unit, using a ground joint union and a manual shut-off valve. National codes require a condensation drip leg to be installed ahead of the gas valve.

The furnace and its individual shut-off valve must be disconnected from the gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 psig (3.5 kPa).

The furnace must be isolated from the gas supply piping by closing its individual manual shut-off valve during any pressure testing of the gas supply piping system at test pressures equal to or less than 1/2 psig (3.5 kPa).

Note: Maximum pressure to the gas valve for natural gas is 13.8-inch W.C. Minimum pressure is 5.0-inch W.C. Maximum pressure to the gas valve for propane is 13.8-inch W.C. Minimum pressure is 11.0-inch W.C.

Table 19. Cubic feet per hour of gas for various pipe sizes and lengths (natural gas only)

Pipe		Length of Pipe								
Size	10	20	30	40	50	60	70			
1/2	131	90	72	62	55	50	46			
3/4	273	188	151	129	114	104	95			
1	514	353	284	243	215	195	179			
1-1/4	1060	726	583	499	442	400	368			

Note: This table is based on Pressure Drop of 0.3-inch W.C. and 0.6 SP.GR. Gas

All gas fittings must be checked for leaks using a soapy solution before lighting the furnace. Do not check with an open flame!

For propane conversions on all other S-Series Furnaces, use BAYLPSS400* conversion kit with stainless steel burners.

Table 20. Orifice sizes

Input Rating	Number of	Main Burner Orifice Drill Size				
втин	Burners	N. Gas	Propane Gas			
40,000	2	45	56			
60,000	3	45	56			
80,000	4	45	56			
100,000	5	45	56			
120,000	6	45	56			

Combustion and Input Check

- Make sure all gas appliances are off except the furnace.
- Clock the gas meter with the furnace operating (determine the dial rating of the meter) for one revolution.
- 3. Match the "Sec" column in the gas flow table with the time clocked.
- Read the "Flow" column opposite the number of seconds clocked.
- 5. Use the following factors if necessary:

- a. For 1 Cu. Ft. Dial Gas Flow CFH = Chart Flow Reading ÷ 2
- b. For 1/2 Cu Ft. Dial Gas Flow CFH = Chart Flow Reading ÷ 4
- c. For 5 Cu. Ft. Dial Gas Flow CFH = 10X Chart Flow Reading ÷ 4
- Multiply the final figure by the heating value of the gas obtained from the utility company and compare to the nameplate rating. This must not exceed the nameplate rating.

Gas Valve Adjustment

Changes can be made by adjusting the manifold pressure, or changing orifices (orifice change may not always be required). To adjust the manifold pressure:

- 1. Turn off all electrical power to the system.
- Loosen (Do not remove) the pressure tap test set screw one turn with 3/32-inch hex wrench.
 - a. The pressure tap adjustment kit (KIT07611) contains a 3/32-inch hex wrench, a 5/16-inch hose and a connector and can be ordered through Global Parts.
- Attach a manifold pressure gauge with flexible tubing to the outlet pressure boss marked "OUT P" on White-Rodgers gas valve model 36J.
- 4. Turn on system power with no call for heat.

Note: 2nd stage manifold pressure should be adjusted first.

To shorten the amount of time it takes for 2nd stage to be energized, set the ISD (Interstage Delay) to zero (000) using the Menu and Option buttons on the IFC. This will energize 2nd stage heating immediately after after the blower on delay from 1st stage is complete. This is ~30 seconds after 1st stage flame has been sensed.

5. Make a call for 2nd stage heating. Insure that the unit is in 2nd stage heating by verifying 24vac is measured between C and HI on the gas valve.

Important: Adjust 2nd stage on the gas valve before attempting to adjust 1st stage.

- 6. Adjust 2nd stage gas heat by removing the high (HI) adjustment regulator cover screw.
 - To increase outlet pressure, turn the regulator adjust screw clockwise.

- To decrease outlet pressure, turn the regulator adjust screw counterclockwise.
- Adjust regulator until pressure shown on manometer matches the pressure specified in the table.

The input of no more than nameplate rating and no less than 93% of the nameplate rating, unless the unit is derated for high altitude.

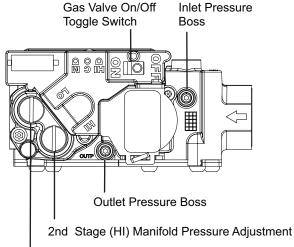

- Replace and tighten the regulator cover screw securely.
- e. Remove call for second stage heat, first stage heat is now running.
- Adjust 1st stage gas heat by removing the low (LO) adjustment regulator cover screw.
 - To increase outlet pressure, turn the regulator adjust screw clockwise.
 - b. To decrease outlet pressure, turn the regulator adjust screw counterclockwise.
 - Adjust regulator until pressure shown on manometer matches the pressure specified in the table.

The input of no more than nameplate rating and no less than 93% of the nameplate rating, unless the unit is derated for high altitude.

- Replace and tighten the regulator cover screw securely.
- 8. Cycle the valve several times to verify regulator setting.
 - a. Repeat Step 5. to Step 7. if needed.
- 9. Turn off all electrical power to the system.
- 10. Remove the manometer and flexible tubing and tighten the pressure tap screw.
- Using a leak detection solution or soap suds, check for leaks at the pressure outlet boss and pressure tap test screw.
- 12. Turn on system power and check operation of the unit.

All models	45	56			

High Altitude Derate

Input ratings (BTUH) of these Furnaces are based on sea level operation and should not be changed at elevations up to 2,000 ft. (610 m).

If the installation is 2,000 ft. (610 m) or above, the Furnace input rate (BTUH) shall be reduced 4% for each 1,000 ft. above sea level.

Installations of this furnace at altitudes above 2,000 ft. (610 m) shall be made utilizing the Part Numbers for Replacement Orifices table in these installation instructions.

The Furnace input rate shall be checked by clocking the gas flow rate (CFH) and multiplying by the heating value obtained from the local utility supplier for the gas being delivered at the installed altitude. Input rate changes can be made by adjusting the Manifold Pressure (min 3.0 - max 3.7 in. W.C. - Natural Gas) or changing orifices (orifice change may not always be required).

If the desired input rate can not be achieved with a change in Manifold Pressure, then the orifices must be changed. Propane installations will require an orifice change.

See the table for help in selecting orifices if orifice change is required. Furnace input rate and temperature rise should be checked again after changing orifices to confirm the proper rate for the altitude.

Turn the main Gas Valve toggle switch within the unit to the "OFF" position. Turn the external gas valve to "ON". Purge the air from the gas lines. After purging, check all gas connections for leaks with a soapy solution – Do not check with an open flame. Allow 5 minutes for any gas that might have escaped to dissipate.

Propane Gas being heavier than air may require forced ventilation. Turn the toggle switch on the Gas Valve in the unit to the "ON" position.

48	ORF01099	58	ORF01338
49	ORF00503	59	ORF01339
50	ORF00493	_	_

Note: For furnaces requiring modifications other than only gas orifice and/or manifold pressure adjustment for installation at high altitude, installation of this furnace at altitudes above 200 ft (610 m) shall be made in accordance with the listed High Altitude Conversion Kit available for this furnace.

The table lists the main burner orifices used with the furnace. If a change of orifices is required to correct the furnace input rating refer to the part number for replacement orifices table.

Installation of this furnace at altitudes above 2000 ft (610m) shall be in accordance with local codes, or in the absence of local codes, the *National Fuel Gas Code, ANSI Z223.1/NFPA 54.*

Table 24. Main burner orifices

Orifice Twist Drill Size If Installed at	Altitude Above Sea Level and Orifice Required at Other Elevations

General Venting

Vent Piping

A WARNING

Carbon Monoxide Poisoning!

Failure to follow instructions below could result in death or serious injury, and property damage.

When removing or placing an existing Category I furnace, confirm the venting system is properly sized.

These furnaces have been classified as Fan-Assisted Combustion System, Category I furnaces under the "latest edition" provisions of ANSI Z21.47 standards. Category I furnaces operate with a non-positive vent static pressure and with a flue loss of not less than 17 percent.

Multistory and common venting are permitted for these furnaces. Venting systems shall be in accordance with the National Fuel Gas Code, ANSI Z223.1/NFPA 54, local codes, and this installation manual.

Note: If desired, a side wall termination can be accomplished through the use of a listed "add-on" draft inducer. The inducer must be installed according to the inducer manufacturer's instructions. Set the barometric pressure relief to achieve –0.02-inch water column.

Important: The furnace shall be connected to a factory built chimney or vent complying with a recognized standard, or a masonry or concrete chimney lined with a lining material acceptable to the authority having jurisdiction.

Venting into a Masonry Chimney

If the chimney is oversized, the liner is inadequate, or flue-gas condensation is a problem in your area, consider using the chimney as a pathway or chase for type "B" vent or flexible vent liner. If flexible liner material is used, size the vent using the "B" vent tables, then reduce the maximum capacity by 20% (multiply 0.80 times the maximum capacity). Masonry Chimney Kit BAYVENT800B may be used with these furnaces (Upflow model furnaces only) to allow venting into a masonry chimney. See the BAYVENT800B Installer's Guide for application requirements.

Internal Masonry Chimneys

Venting of fan assisted appliances into a lined, internal masonry chimney is allowed only if it is common vented with at least one natural draft appliance; or, if the chimney is lined with type "B", double wall vent or suitable flexible liner material

A WARNING

Carbon Monoxide Poisoning!

Failure to follow instructions below could result in death, serious injury, or property damage. Inspect the chimney liner thoroughly to verify no cracks or other potential areas for flue gas leaks are present in the liner. Liner leaks will result in early damage to the chimney.

The following section does not apply if BAYVENT800B (Masonry Chimney Vent Kit) is used. All instructions with the kit must be followed.

Table 26. Masonry chimney venting

Type Furnace	Tile Lined Chimney		Chimney Lining	
Type I amade	Internal	External	"B" Vent	Flexible Metal Liner
Single Fan Assist	No	No	Yes	Yes (a)
Fan Assist + Fan Assist	No	No	Yes	Yes
Fan Assist + Natural	Yes	No	Yes	Yes

⁽a) Flexible chimney liner size is determined by using the type "B" vent size for the available BTUH input, then reducing the maximum capacity by 20% (multiply maximum capacity times 0.80). The minimum capacity is the same as shown in the "B" vent tables.

External Masonry Chimney

Venting of fan assisted appliances into external chimneys (one or more walls exposed to outdoor temperatures), requires the chimney be lined with type "B", double wall vent or suitable flexible chimney liner material. This applies in all combinations of common venting as well as for fan assisted appliances vented alone.

The following installation practices are recommended to minimize corrosion caused by condensation of flue products in the furnace and flue gas system.

- 1. Avoid an excessive number of bends.
- 2. Horizontal runs should pitch upward at least 1/4-inch per foot.
- 3. Horizontal runs should be as short as possible.

- All vent pipe or connectors should be securely supported and must be inserted into, but not beyond the inside wall at the chimney vent.
- When vent connections must pass through walls or partitions of combustible material, a thimble must be used and installed according to local codes.
- Vent pipe through the roof should be extended to a height determined by National Fuel Gas Code or local codes. It should be capped properly to prevent rain water from entering the vent. Roof exit should be waterproofed.
- 7. Use type "B" double wall vent when vent pipe is routed through cool spaces (below 60° F.).
- 8. Where long periods of airflow are desired for comfort, use long fan cycles instead of continuous airflow.
- Apply other good venting practices as stated in the venting section of the National Fuel Gas Code ANSI Z223.1 "latest edition".
- 10. Vent connectors serving appliance vented by natural draft or non positive pressure shall not be connected into any portion of a mechanized draft system operating under positive pressure.
- 11. Horizontal pipe runs must be supported by hangers, straps or other suitable material in intervals at a minimum of every 3 feet of pipe.
- A furnace shall not be connected to a chimney or flue serving a separate appliance designed to burn solid fuel.
- 13. The flow area of the largest section of vertical vent or chimney shall not exceed 7 times the smallest listed appliance categorized vent area, flue collar area, or draft hood outlet area unless designed in accordance with approved engineering methods.

Maximum Vent or Tile Lined Chimney Flow Area = $[\pi(D^*)2]/4 \times 7$

* Drafthood outlet diameter, flue collar diameter, or listed appliance categorized vent diameter.

Table 27. Gas vent termination

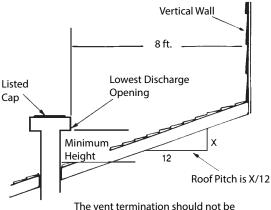

Roof Pitch	Minimum Height
Flat to 6/12	1.0 Feet ^(a)
Over 6/12 to 7/12	1.25 Feet
Over 7/12 to 8/12	1.5 Feet
Over 8/12 to 9/12	2.0 Feet
Over 9/12 to 10/12	2.5 Feet
Over 10/12 to 11/12	3.25 Feet
Over 11/12 to 12/12	4.0 Feet
Over 12/12 to 14/12	5.0 Feet
Over 14/12 to 16/12	6.0 Feet
Over 16/12 to 16/12	7.0 Feet

Table 27. Gas vent termination (continued)

Roof Pitch	Minimum Height
Over 18/12 to 20/12	7.5 Feet
Over 20/12 to 21/12	8.0 Feet

⁽a) This requirement covers most installations

Figure 16. Gas vent termination

less than 8 ft. from a vertical wall.

Air for Combustion and Ventilation

Adequate flow of combustion and ventilating air must not be obstructed from reaching the Furnace. Air openings provided in the Furnace casing must be kept free of obstructions which restrict the flow of air. Airflow restrictions affect the efficiency and safe operation of the Furnace. Keep this in mind should you choose to remodel or change the area which contains your Furnace. Furnaces must have a free flow of air for proper performance.

Provisions for combustion and ventilation air shall be made in accordance with "latest edition" of Section 9.3, Air for Combustion and Ventilation, of the National Fuel Gas Code, ANSI Z223.1 / NFPA 54. Installation Codes, and applicable provisions of the local building codes. Special conditions created by mechanical exhausting of air and fireplaces must be considered to avoid unsatisfactory Furnace operation.

Furnace location may be in an unconfined space or a confined space.

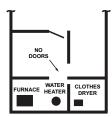

Unconfined space are installations with 50 cu. ft. or more per 1000 BTU/hr input from all equipment installed. Unconfined spaces are defined in the table and illustration for various furnace sizes. These spaces may have adequate air by infiltration to provide air for combustion, ventilation, and dilution of flue gases. Buildings with tight construction (for example, weather stripping, heavily insulated, caulked, vapor barrier, etc.), may need additional air provided as described for confined space.

Table 28. Minimum area in square feet for unconfined space installations

Furnace Maximum BTUH Input Rating	With 8 Ft. Ceiling, Minimum Area in Square Feet of Unconfined Space
40,000	250
60,000	375
80,000	500
100,000	625
120,000	750

Figure 17. Unconfined space

50 CU. FT. OR MORE PER 1000 BTU/HR INPUT ALL EQUIP. INSTALLED

Confined spaces are installations with less than 50 cu. ft. of space per 1000 BTU/ hr input from all equipment installed. Confined spaces are defined in the table and illustration for various furnace sizes. Air for combustion and ventilation requirements can be supplied from inside the building.

- The following types of installations will require use of OUTDOOR AIR for combustion, due to chemical exposures:
 - · Commercial buildings
 - · Buildings with indoor pools
 - · Furnaces installed in commercial laundry rooms
 - · Furnaces installed in hobby or craft rooms
 - Furnaces installed near chemical storage areas
- Exposure to the following substances in the combustion air supply will also require OUTDOOR AIR for combustion:
 - · Permanent wave solutions
 - · Chlorinated waxes and cleaners
 - · Chlorine based swimming pool chemicals
 - · Water softening chemicals
 - Deicing salts or chemicals
 - · Carbon Tetrachloride
 - Halogen type refrigerants
 - · Cleaning solvents (such as perchloroethylene)
 - Printing inks, paint removers, varnish, etc.
 - · Hydrochloric acid
 - · Cements and glues
 - Antistatic fabric softeners for clothes dryers
 - Masonry acid washing material

Note: Extended warranties are not available in some instances. Extended warranty does not cover repairs to equipment installed in establishments with corrosive atmospheres, including but not limited to, dry cleaners, beauty shops, and printing facilities.

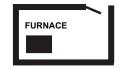

Table 29. Minimum free area in square inches each opening (furnace only) in a confined space

Furnace Max	A: F	Air From Outside		
BTUH.Input Rtg.	Air From Inside	Vertical Duct	Horizontal Duct (b)	
40,000	100	10	20	
60,000	100	15	30	
80,000	100	20	40	
100,000	100	25	50	
120,000	100	30	60	

- (a) 1 Square inch per 4000 BTU/hr Vertical Duct.
- (b) 1 Square inch per 2000 BTU/hr Horizontal Duct.

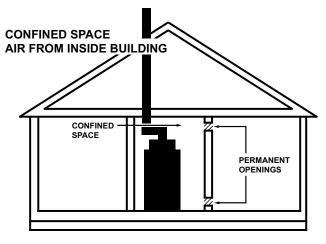

Figure 18. Confined space

LESS THAN 50 CU. FT. PER 1000 BTU/HR INPUT ALL EQUIP. INSTALLED

All air from inside the building The confined space shall be provided with two permanent openings communicating directly with an additional room(s) of sufficient volume so that the combined volume of all spaces meets the criteria for an unconfined space. The total input of all gas utilization equipment installed in the combined space shall be considered in making this determination. Refer to the Minimum Free Area in square inches for confined spaces table, for minimum open areas required.

Figure 19. Air from inside building

All air from outdoors — The confined space shall be provided with two permanent openings, one commencing

within 12 inches of the top and one commencing within 12 inches of the bottom of the enclosure.

The openings shall communicate directly, or by ducts, with the outdoors or spaces (crawl or attic) that freely communicate with the outdoors. See the Minimum Free Area in square inches for confined spaces table, for minimum open areas required.

Figure 20. Air from outdoors

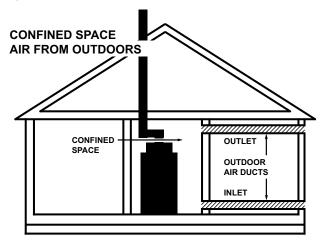

Figure 21. Air from ventilated attic/crawl space

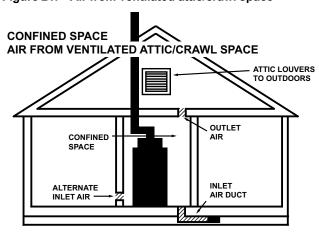

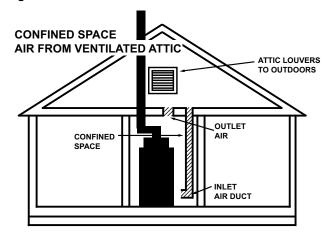

Figure 22. Air from ventilated attic

Duct Connections

Air duct systems should be installed in accordance with standards for air conditioning systems, National Fire Protection Association Pamphlet No. 90. They should be sized in accordance with ACCA Manual D or whichever is applicable. Check on controls to make certain they are correct for the electrical supply.

Central furnaces, when used in connection with cooling units, shall be installed in parallel or on the upstream side of the cooling units to avoid condensation in the heating element, unless the furnace has been specifically approved for downstream installation. With a parallel flow arrangement, the dampers or other means used to control flow of air shall be adequate to prevent chilled air from entering the furnace, and if manually operated, must be equipped with means to prevent operation of either unit unless the damper is in full heat or cool position.

Flexible connections of nonflammable material may be used for return air and discharge connections to reduce the transmission of vibration. Though these units have been specifically designed for quiet, vibration free operation, air ducts can act as sounding boards and could, if poorly installed, amplify the slightest vibration to the annoyance level.

Where there is no complete return duct system, the return connection must be run full size from the Furnace to a location outside the utility room, basement, attic, or crawl space.

Important: Do not install return air through the back of the furnace cabinet and through the side of the furnace cabinet on horizontal applications without following the guidelines in "Return Air Filters," p. 43.

Carbon monoxide, fire or smoke can cause serious bodily injury, death, and/or property damage.

A variety of potential sources of carbon monoxide can be found in a building or dwelling such as gas-fired clothes dryers, gas cooking stoves, water heaters, furnaces and fireplaces. The U.S. Consumer Product Safety Commission recommends that users of gas-burning appliances install carbon monoxide detectors as well as fire and smoke detectors per the manufactures installation instructions to help alert dwelling occupants of the presence of fire, smoke or unsafe levels of carbon monoxide. These devices should be listed by Underwriters Laboratories, Inc. Standards for Single and Multiple Station Carbon Monoxide Alarms, UL 2034.

When the furnace is located in a utility room adjacent to the living area, the system should be carefully designed with returns which minimize noise transmission through the return air grille. Although these winter air conditioners are designed with large blowers operating at moderate speeds, any blower moving a high volume of air will produce audible noise which could be objectionable when the unit is located very close to a living area. It is often advisable to route the return air ducts under the floor or through the

attic. Such design permits the installation of air return remote from the living area (i.e. central hall).

When the furnace is installed so that the supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air shall also be handled by a duct(s) sealed to the furnace and terminating outside the space containing the furnace.

For furnaces not equipped with a cooling coil, it is recommended that the outlet duct be provided with a removable access panel. The opening shall be accessible when the furnace is installed and shall be of such a size that the heat exchanger can be viewed for possible openings using light assistance or a probe can be inserted for sampling the air stream. The removable cover must be sealed to prevent air leaks.

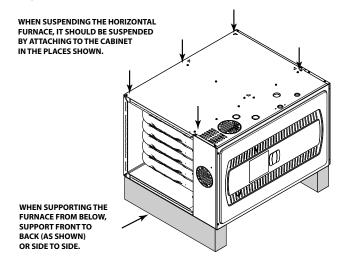

Notes:

- 1. Seal per local codes.
- The manufacturer of your Furnace does not test any detectors and makes no representations regarding any brand or type of detector.

In horizontal applications, the furnace must be supported with one of the following methods.

- Support below with non-combustible material as shown in the illustration.
- 2. Use BAYHANG kit. See kit instructions.
- Use unistrut with cabling to provide support from under the unit.
- 4. Use strapping material in locations shown in illustration.

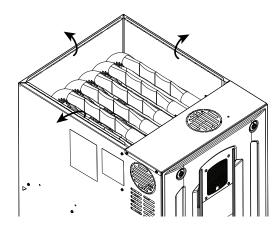

Figure 23. Horizontal installation with supports

Supply Duct Connections

Note: There are no longer guide holes located on the furnace flange.

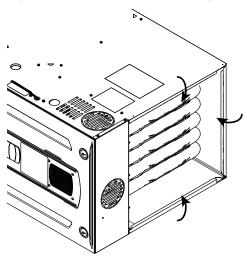

Figure 24. Upflow furnace with coil

See Step 1., Step 3., Step 5., Step 7.

Note: Flat or dedicated horizontal coils may require flanges to be bent upward.

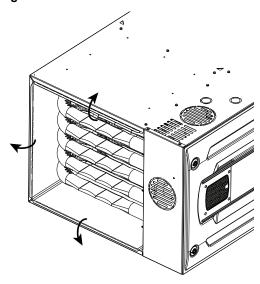

Figure 25. Furnace in horizontal right with "A" coil

See Step 2., Step 4.

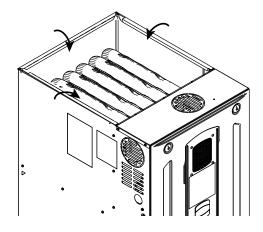

Note: There are no longer guide holes located on the furnace flange.

Figure 26. Furnace in horizontal left with coil

See Step 1., Step 4., Step 5., Step 7.

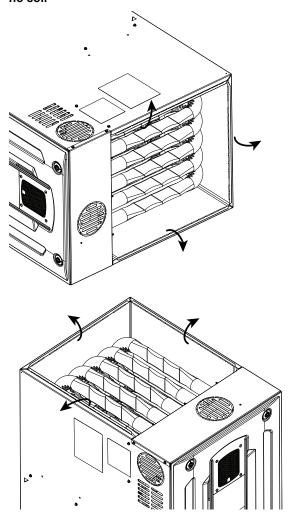

Figure 27. Downflow furnace with coil

See Step 2., Step 4.

Important: BAYBASE is required when installing the furnace on a combustible floor.

Figure 28. Horizontal right and downflow furnace — no coil

See Step 1., Step 6., Step 7.

Installation Steps

- 1. Bend furnace flanges up.
- 2. Bend furnace side flanges down.
- 3. Set the coil on top of the furnace.
- 4. Support the furnace and coil independently.
- Screw through the coil cabinet into the furnace flange. Guide holes are located on the coil.
- 6. Attach ducting.
- 7. Seal per local codes and requirements.

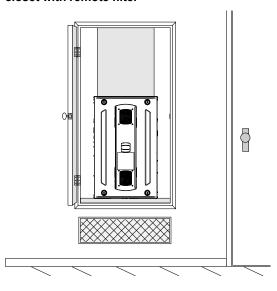

Return Duct Connections

Return Ducting General Guidelines

- · Back returns are not allowed on any S-Series Furnaces
- Side returns are not allowed on downflow or horizontal S-Series Furnaces
- · Mounting flanges must be located on ducting

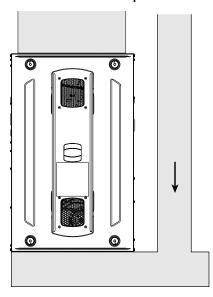

- Shoot screws through the mount flanges into the furnace cabinet
- Always seal per local codes and requirements
- Furnace, coil, and ducting must be supported separately
- An external overflow drain pan must be installed in all applications over a finished ceiling to prevent property damage

Figure 29. Upflow furnace with bottom return in closet with remote filter

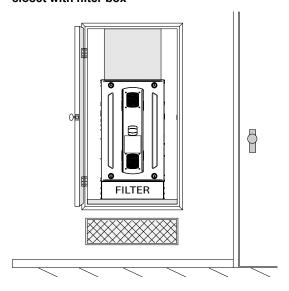

See Step 1., Step 2., Step 3., and Step 8.

Figure 30. Upflow furnace with bottom return mounted on a ducted pedestal

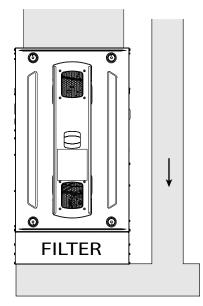

See Step 1., Step 6., Step 3., and Step 8.

Figure 31. Upflow furnace with bottom return in closet with filter box

See Step 1., Step 4., Step 5., and Step 8.

Figure 32. Upflow furnace with bottom return mounted on a ducted pedestal with filter box

See Step 1., Step 7., and Step 8.

Installation Steps

- 1. Remove the bottom plate.
- 2. Set the furnace on the base inside closet.
- 3. Install remote filter.
- 4. Set the furnace on the filter box inside closet.
- 5. Must have grille present for air.
- 6. Set the furnace on the ducted pedestal. The ducted pedestal will use ducted air from a remote location.

- 7. Set the furnace on the filter box. The ducted pedestal will use ducted air from a remote location.
- 8. Seal per local codes and requirements.

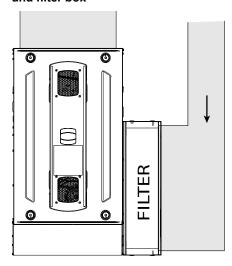

Important:

- Make sure the thermostat wiring hole is sealed on the cabinet side with the side return.
- 2. Make sure not to cut the cabinet in the "No Cut" area.

Notes:

- 1. Use Optional BAYLIFT kit to lift furnace. Follow kit instructions.
- 2. The furnace bottom pedestal must be a minimum of 6-inch in height.

Figure 33. Upflow furnace with bottom and side returns mounted on a ducted pedestal with side return and filter box

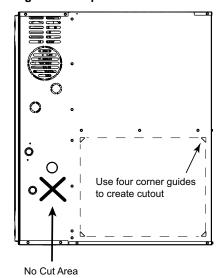

See Step 1. to Step 8.

Important:

- Make sure the thermostat wiring hole is sealed on the cabinet side with the side return.
- 2. Make sure not to cut the cabinet in the "No Cut" area.

Note: If using a filter box, use a transition, if possible, to attach the filter box to the furnace cabinet.

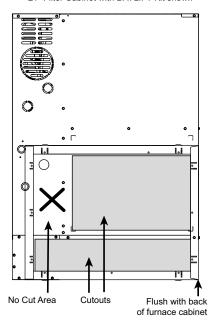

Figure 34. Upflow Furnace with side return

See Step 9. to Step 12.

Figure 35. Cabinet cutout when used with BAYLIFT

21" Filter Cabinet with BAYLIFT Kit shown

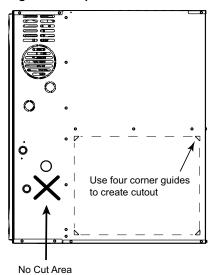

Important:

- One of the sides must have a transition to allow the thermostat wiring to exit the cabinet.
- 2. If a transition is not a viable option, a hole will need to be drilled in the side of the cabinet for the thermostat wiring to exit.
- 3. Make sure not to cut the cabinet in the "No Cut" area.

Notes:

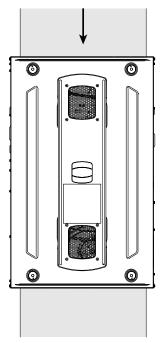

- 1. If using one transition, the thermostat wiring will exit on the transition side.
- 2. If using a filter boxes, use transitions, if possible, to attach the filter boxes to the furnace cabinet.

Figure 36. Upflow furnace with two side returns

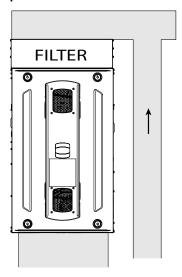

See Step 9. to Step 12.

Figure 37. Downflow furnace with top return

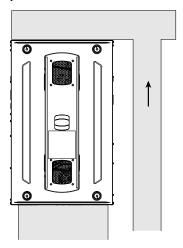

See Step 13., Step 14., Step 17., and Step 8.

Figure 38. Downflow furnace with top return and plenum with filter box

See Step 13., Step 16., Step 14., and Step 8.

Figure 39. Downflow furnace with top return and plenum

See Step 13., Step 15., Step 17., and Step 8.

Installation Steps

- 1. Remove the bottom plate.
- 2. Create ducting and set the furnace in place.
- Match the filter cabinet flush to the back and bottom sides of the furnace cabinet and secure in place with screws.
- 4. Mark the two areas to be cut out for the return air.
- 5. Cut out the two sections of the cabinet and BAYLIFT kit to be removed.
- 6. Attach ducting to the filter box.
- 7. The ducted pedestal will use ducted air from a remote location.
- 8. Seal per local codes and requirements.

- 9. Using guides, remove the cutout for the side return.
- Create ducting and set the furnace in place. Use screws to attach ducting to the furnace cabinet.
- 11. Seal bottom panel per local codes and requirements.
- 12. Seal all other panels per local codes and requirements.
- 13. Remove the top plate.
- 14. Attach the ducting to the top of the furnace.
- 15. Attach the plenum ducting to the top of the furnace.
- 16. Attach the filter box to the top of the furnace.
- 17. Install remote filter.

Return Air Filters

Typical Air Filter Installations

Filters are not factory supplied for furnaces. Filter size needed will be dependent on type of filter and CFM requirement. Filters must be installed externally to the unit.

Important: It is recommended to transition return ducting to the same size as the opening. It is acceptable for return duct or filter frame to extend forward of the opening but plastic plugs must be installed in any opening that the duct or filter frame may cover.

Table 30. Return air filters

Furnace Width (in.)	Filter Qty and Size (in.)	
14–1/2	1 — 14 x 25 x 1	
17–1/2	1 — 16 x 25 x 1	
21	1 — 20 x 25 x 1	
24–1/2	1 — 24 x 25 x 1	

Note: For upflow airflow furnaces where the airflow requirement exceeds 1600 CFM - Furnaces will require return air openings and filters on: (1) both sides, or (2) one side and the bottom, or (3) just on the bottom.

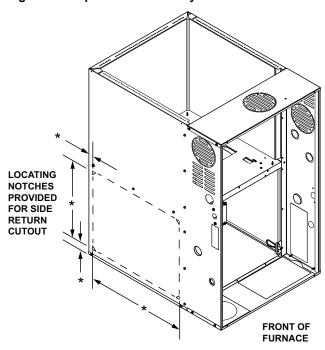

Preparation for Upflow Bottom and Side Return Air Filter Installations

All return air duct systems should provide for installation of return air filters.

- Determine the appropriate position to set the furnace in order to connect to existing supply and return ductwork.
- For upflow side return installations, remove the insulation around the opening in the blower compartment
- The side panels of the upflow furnace include locating notches that are used as guides for cutting an opening for return air, see the figure and the upflow furnace outline drawing for duct connection dimensions for various furnaces.
- 4. If a 3/4-inch flange is to be used for attaching the air inlet duct, add to cut where indicated by dotted lines.

- Cut corners diagonally and bend outward to form flange.
- 5. If flanges are not required, and a filter frame is installed, cut between locating notches as in illustration.
- 6. The bottom panel of the upflow furnace must be removed for bottom return air.

Figure 40. Upflow furnaces only

Note: See dimensional data drawing.

Return air filters for furnace in horizontal configuration

When the furnace is installed in the horizontal configuration, the return air filters must be installed exterior to the furnace cabinet. Remote filter grilles may be used for homeowner convenience, see Figure 41, p. 44 or the filters may be installed in the duct work upstream of the furnace, see .

Filter kits are available for horizontal applications.

Note: Direct coupled side returns are not allowed to the blower cabinet.

Figure 41. Remote filter installation

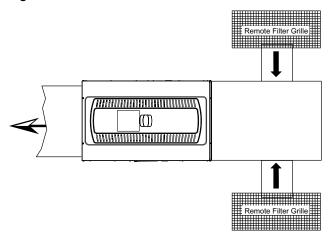

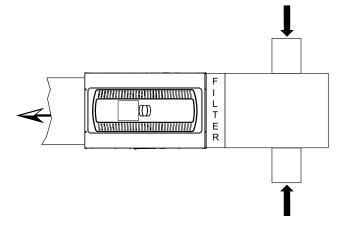

Figure 42. Duct filter installation

Electrical Connections

Make wiring connections to the unit as indicated on enclosed wiring diagram. As with all gas appliances using electrical power, this furnace shall be connected into a permanently live electric circuit. It is recommended that furnace be provided with a separate circuit protection device electric circuit. The furnace must be electrically grounded in accordance with local codes or in the absence of local codes with the National Electrical Code, ANSI/NFPA 70, if an external electrical source is utilized. The integrated furnace control is polarity sensitive. The hot leg of the 120V power supply must be connected to the black power lead as indicated on the wiring diagram.

See the "Wiring Diagrams," p. 17 in this document and unit wiring diagram attached to furnace.

A WARNING

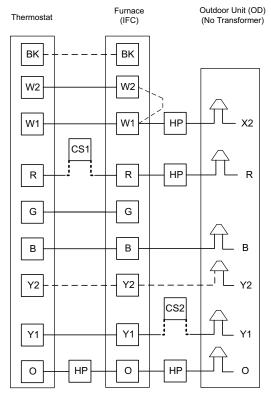

Fire Hazard!

Failure to follow instructions below could result in death or serious injury or property damage.

For installations with flammable refrigeration system, the furnace must be powered at all times except during servicing. The furnace must be installed and connected according to installation instructions and wiring diagrams provided with the evaporator coil.

24V Field Wiring

Figure 43. Field wiring for S8V2-C with one or two stage AC or heat pump

NOTES:

- 1) HP = Wiring used for Heat Pump System.
- 2) CS = wiring used for Condensate Switch (2 Options).
- 3) Y1 and/or Y2 must be connected from the thermostat to the IFC for proper airflow.
- Remove Y1-O jumper for HP systems. O terminal must be connected as shown for gas heating operation during defroet.
- 5) If the thermostat does rtdhave a W2, or there are not enough conductors, jumper W1 to W2 at the IFC.
- 6) A/TCONT824 thermostats do not require the use of X2.
- 7) For PWM (BK) enabled thermostats, cut the BK jumper on the IFC and connect wiring.

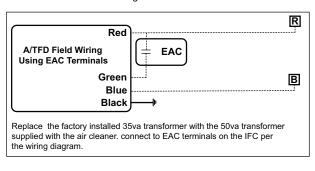

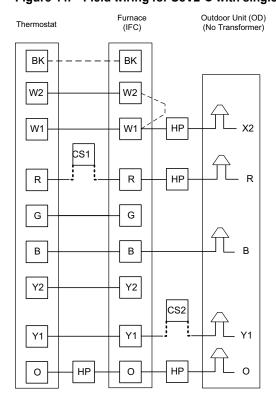

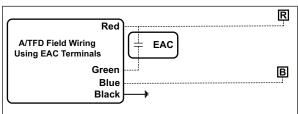

Figure 44. Field wiring for S8V2-C with single stage AC or heat pump with two stage airflow

NOTES

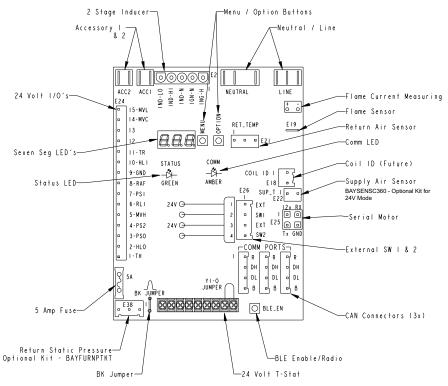

- 1) HP = Wiring used for Heat Pump System.
- 2) CS = wiring used for Condensate Switch (2 Options).
- Y1 and Y2 must be connected from the thermostat to the IFC for proper airflow.
- 4) Thermostat must be setup for 2 stage OD.
- 5) IFC Must be setup for 2 stage OD using the Menu/Option Buttons.
- Remove Y1-O jumper for HP systems. O terminal must be connected as shown for gas heating operation during defrost.
- If the thermostat does rthave a W2, or there are not enough conductors, jumper W1 to W2 at the IFC.
- 8) A/TCONT824 thermostats do not require the use of X2.
- 9) For PWM (BK) enabled thermostats, cut the BK jumper on the IFC and connect wiring.

Replace the factory installed 35va transformer with the 50va transformer supplied with the air cleaner. connect to EAC terminals on the IFC per the wiring diagram.

Secure the sheathed wiring to the IFC using the factory supplied wire ties.

Figure 45. S8V2 IFC layout

2. Mount Supply Air Temperature Sensor

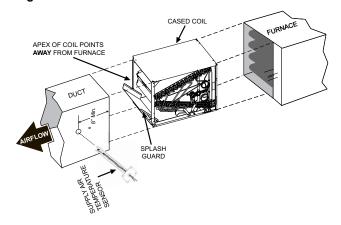

The Supply Air Sensor (BAYSENSC360) must be mounted on the leaving side of the cooling coil, or the maximum distance allowed by the wire length on a furnace only application. Testing has shown the left side of the plenum delivers the best average temperature. If the left side cannot be used, take several readings to determine the best place to mount the sensor for your application.

The Supply Air Sensor plugs into connector E22 of the IFC (See IFC layout). In the Diagnostic App, this sensor is defaulted OFF and must be configured to ON.

Notes:

- Supply Air Temp Sensor (SAT) is used in Link Communicating mode and is optional in 24 volt mode.
- Supply Air Temp Sensor (SAT) ships with SC360 System Controller.
- Supply Air Sensor kit is BAYSENSC360.
- The return air sensor is located within the blower wiring harness, behind the blower panel. In the Diagnostic App, this sensor is defaulted ON.

Figure 46. S8V2 Furnace and cased coil with duct

The Table 31, p. 47 table defines the size and combined total maximum length of the low voltage wiring from the outdoor unit, to the indoor unit, and to the thermostat.

Note: The use of color coded low voltage wire is recommended to simplify connections between the outdoor unit, the control, and the indoor unit.

Table 31. Low voltage maximum wire length

Control Wire — Communicating			
Wire Size Max. Wire Length			
18 AWG	500 FT. Combined		
Control Wire — 24 Volt			
Wire Size	Max. Wire Length		
18 AWG	100 FT. Combined		

Link mode uses simple connectors for low voltage connections. These connections are color coded which makes the installation easier and quicker.

Table 32. Link communicating low voltage wire connectors

Wire Colors		
R	Red	
DH	White	
DL	Green	
В	Blue	

Do the following to make the connections from the actual thermostat wire to the connector.

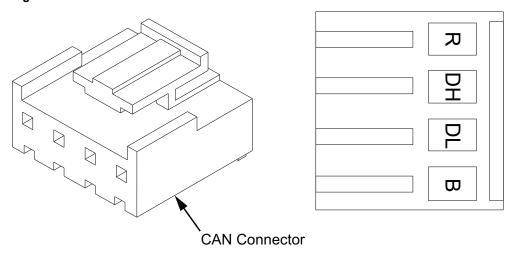

Note: These connectors are necessary at the communicating outdoor unit, communicating indoor unit, distribution board(s), system controller and communicating accessories.

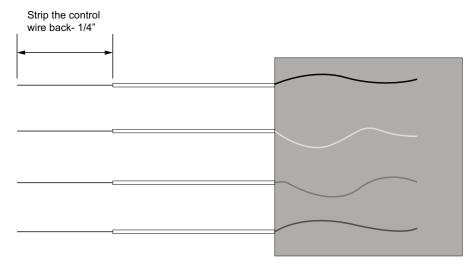

- 1. Strip the Red, White, Green and Blue thermostat wires back 1/4-inch.
- Insert the wires into the connector in the correctly colored locations.
- When you feel it release, allow each wire to slide in further.
- Pull back on the wires individually and slightly and check if the wires are seated properly. If each wire does not pull out for all four wires, the connection is complete.
- Connectors are one time use. If a 18 ga. Thermostat wire gets broken off inside of the connector, the connector will need replaced.
- 6. Wire colors are for illustration purposes only. If using a different color, ensure it lands at the correct terminal throughout all of the communicating control wiring.

Connect the CAN connector into the male coupling on the low voltage harness at the Outdoor unit.

This furnace has three dedicated CAN connectors on the Integrated Furnace Control (IFC). In Link communicating mode, all of them are in the communicating loop. It does not matter which connector is used for the Thermostat, System Controller (HUB), or Outdoor unit. Link accessories can be connected to the Distribution Board if needed.

Figure 47. Can connectors

Note: For use with 18 ga. solid core thermostat wire.

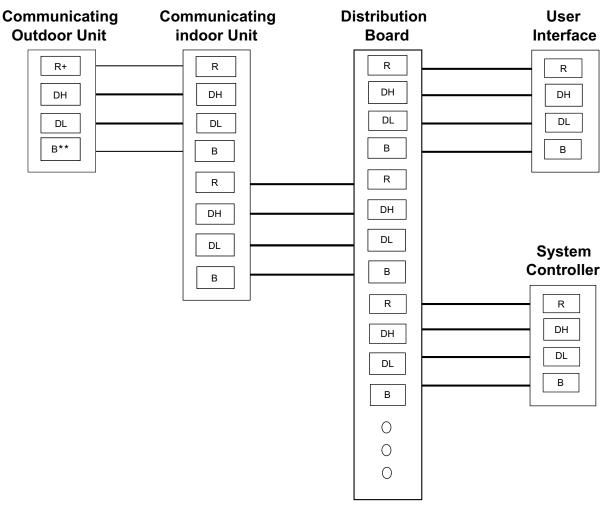

Figure 48. Link communicating low voltage connection diagrams

Table 33. Link communicating low voltage wire connectors

Wire Colors		
R	Red	
DH	White	
DL	Green	
В	Blue	

Notes:

- + R connection to the outdoor unit is required only in applications utilizing an outdoor loadshed device or when using SmartCharge.
- ** B connection to the outdoor unit is optional for 2 wire outdoor applications, but is recommended in other applications.
- *** DATA (Brown) wire only used in Clii mode.
- Wire colors are for illustration purposes only. If using a different color, ensure it lands at the correct terminal throughout all of the communicating control wiring.
- DATA (Brown) wire only used in Clii mode.

External Switches and Accessories

When connecting a humidifier or electronic air cleaner to the furnace, use ACC1 or ACC2.

 Accessory 1 and 2 are dry contacts need source voltage from the accessory.

 External switches 1 and 2 have 24 vac source voltage and are to be connected to Normally Closed (NC) contacts on the device, i.e smoke detector.

Notes:

- In Link Communicating mode, Accessories and External Switches can be configured in the UX360 User Interface or Diagnostics Mobile app.
- In 24V mode, Accessories and External Switches must be configured in the Diagnostics Mobile app.

Figure 49. Accessory

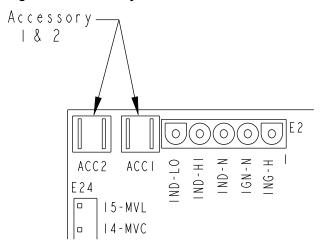

Figure 50. External switch

вк	Black	

General Start-Up and Adjustment

The following sections provide instructions for the general start-up and adjustment of the gas furnaces.

Preliminary Inspections

With gas and electrical power "OFF", confirm:

- 1. Duct connections are properly sealed.
- 2. Filters are in place.
- 3. Venting is properly assembled.
- 4. Blower vestibule panel and all screws are in place.

Turn knob on main gas valve within the unit to "OFF". Turn the external gas valve to "ON". Purge the air from the gas lines. After purging, check all gas connections for leaks with a soapy solution.

Do not check with an open flame allow 5 minutes for any gas that might have escaped to dissipate. Turn the gas valve in the unit to the "ON" position.

Propane Gas being heavier than air may require forced ventilation. Turn the toggle switch on the Gas Valve in the unit to the "ON" position.

Lighting Instructions

Lighting instructions appear on each unit. Each installation must be checked out at the time of initial start up to ensure proper operation of all components. Check out should include putting the unit through one complete cycle as outlined below.

Turn on the main electrical supply and set the comfort control above the indicated temperature. The igniter will automatically heat, then the gas valve is energized to permit the flow of gas to the burners. After ignition and flame is established, the flame control module monitors the flame and supplies power to the gas valve until the comfort control is satisfied.

A WARNING

Risk of Fire or Explosion!

Failure to follow instruction below could result in death or serious injury or property damage.

Do NOT attempt to manually light the furnace.

To shut off

For complete shutdown: Turn the toggle or control switch located on the main gas valve inside the unit to the "OFF" position and the external main gas shutoff valve to the "OFF" position. Disconnect the electrical supply to the unit.

Whenever your house is to be vacant, arrange to have someone inspect your house for proper temperature. This is very important during freezing weather. If for any reason your furnace should fail to operate damage could result, such as frozen water pipes.

A CAUTION

Freeze Damage!

Failure to follow instructions below could result in minor to moderate injury or property damage. During complete furnace shutdown during cold weather, take measures to prevent water pipes and receptacles from freezing.

Control and Safety Switch Adjustment

Limit Switch Check Out

The limit switch is a safety device designed to close the gas valve should the furnace become overheated. Since proper operation of this switch is important to the safety of the unit, it must be checked out on initial start up by the installer.

To check for proper operation of the limit switches, set the thermostat to a temperature higher than the indicated temperature to bring on the gas valve. Restrict the airflow by blocking the return air to the blower. When the furnace reaches the maximum outlet temperature as shown on the rating plate, the burners must shut off. If they do not shut off after a reasonable time and overheating is evident, a faulty limit switch is probable and the limit switch must be replaced. After checking the operation of the limit control, be sure to remove the paper or cardboard from the return air inlet, or reconnect the blower.

FNR-SVX003A-EN 5⁻

Furnace Combustion Air Exhaust Options

Note: Default is left side for electric and gas connections.

The following sections give instructions for the different furnace orientations and the options for venting the exhaust combustion air.

Important: When looking at the different orientations, the direction of the combustion air exhaust in the illustration's description is after the furnace has been rotated, if needed.

Venting Options for Upflow Applications

See the illustrations below to find the approved venting options for upflow furnace.

Important: The exhaust must be vented to the outdoors.

Figure 51. Upflow orientation or installation

Combustion air exhaust vented out at the top.

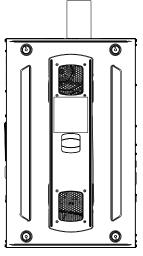

Figure 52. Upflow orientation or installation

Combustion air exhaust vented through left side.

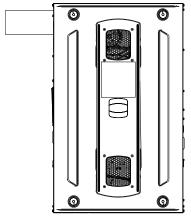

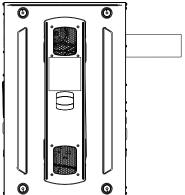

Figure 53. Upflow orientation or installation

Combustion air exhaust vented through right side.

Venting Options for Horizontal Left Applications

See the illustrations below to find the approved venting options for horizontal left furnace.

Important: The exhaust must be vented to the outdoors.

Note: 4-inch Type B double wall vent pipe must be used inside of the furnace cabinet.

Vented out top.

Figure 54. Horizontal left orientation or installation

Combustion air exhaust Vented out at the top.

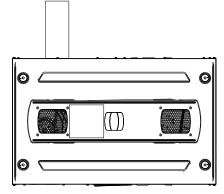

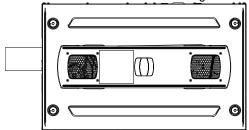

Figure 55. Horizontal left orientation or installation

Combustion air exhaust vented through left side.

Venting Options for Horizontal Right Applications

See the illustrations below to find the approved venting options for horizontal right furnace.

Important: The exhaust must be vented to the outdoors.

Note: 4-inch Type B double wall vent pipe must be used inside of the furnace cabinet.

Figure 56. Horizontal right orientation or installation

Combustion air exhaust vented out at the top.

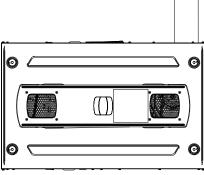

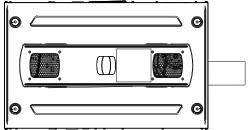

Figure 57. Horizontal right orientation or installation

Combustion air exhaust vented through right side.

Venting Options for Downflow Applications

See the illustrations below to find the approved venting options for downflow furnace models.

Important: The combustion air exhaust must be vented to the outdoors.

Notes:

- 4-inch Type B double wall vent pipe must be used inside of the furnace cabinet.
- Requires kit BAYVENT600. Kit used with B, C, and D cabinets only.
- 3. "A" cabinet furnaces must be vented through the left of right side openings.

Figure 58. Downflow orientation or installation

Combustion air exhaust vented out at the top.

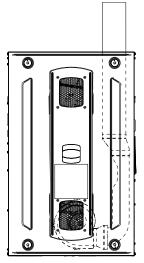

Figure 59. Downflow orientation or installation

Combustion air exhaust vented through left side.

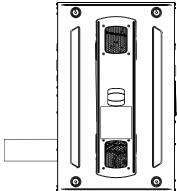

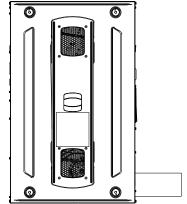

Figure 60. Downflow orientation or installation

Combustion air exhaust vented through right side.

Combustion Air Conversions

Important: After deciding the orientation of the flue outlet, cut the metal tabs around the appropriate 5-inch metal cutout on the furnace cabinet and remove the cutout, if necessary.

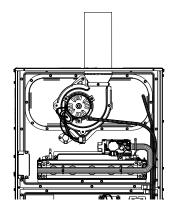

Notes:

- When rotating the inducer it may be necessary to cut the wire tie. A new wire tie must be installed once the inducer is rotated.
- Self-tapping screws are recommended for attaching the vent pipe to the inducer outlet.

Pressure Switch locations

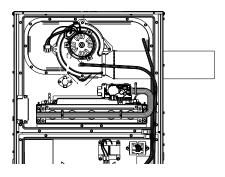

S8V2: PS1 is connected to the inducer. PS2 is connected to the hot header.

Figure 61. Upflow orientation with top venting

See Step 1.

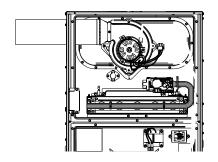

Figure 62. Upflow orientation with right side venting

See Step 2. to Step 6.

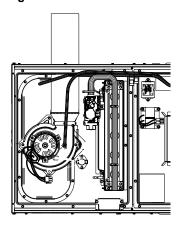

Note: When rotating the inducer it may be necessary to cut the wire tie. A new wire tie must be installed once the inducer is rotated.

Figure 63. Upflow orientation with left side venting

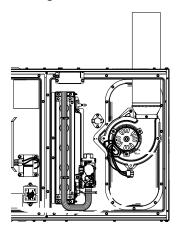

See Step 2. to Step 6.

Figure 64. Horizontal left orientation with top venting

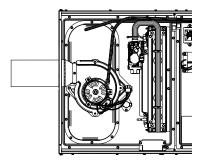

See Step 2. to Step 6.

Figure 65. Horizontal right orientation with top venting

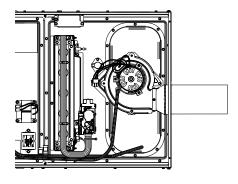

See Step 2. to Step 5. and Step 7.

Figure 66. Horizontal left orientation with left side venting

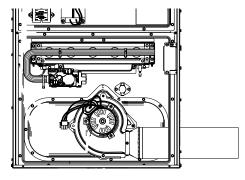

See Step 1.

Figure 67. Horizontal right orientation with right side venting

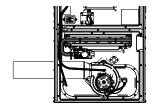

See Step 1.

Figure 68. Downflow orientation with right side venting

See Step 2. to Step 6.

Figure 69. Downflow orientation with left side venting

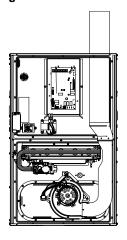

See Step 2. to Step 6.

Notes:

- Requires kit BAYVENT600. Kit used with B, C, and D cabinets only. Follow kit instructions for installation.
- 2. 4-inch Type B double wall vent pipe must be used inside of the furnace cabinet.

Figure 70. Downflow orientation with top venting

See Step 2., Step 3., Step 4., Step 8. and Step 6.

Installation Steps

- No changes need to be made to the inducer when installing the furnace in upflow position when vented through the top.
- 2. Before proceeding, lay unit on its back to make the conversion easier.
- 3. Remove the four screws holding the inducer in place.
- 4. Rotate the inducer so the inducer outlet is pointing towards the 5-inch cutout.
- 5. Secure the inducer in place using the screws removed in Step 3..
- 6. Attach the vent to the inducer outlet.
- 7. Attach the vent outlet gasket to the vent outlet.
- 8. Install BAYVENT600 kit per the kit instructions.

Integrated Furnace Control Menu

Figure 71. Control system menu (24V) - S8V2-C

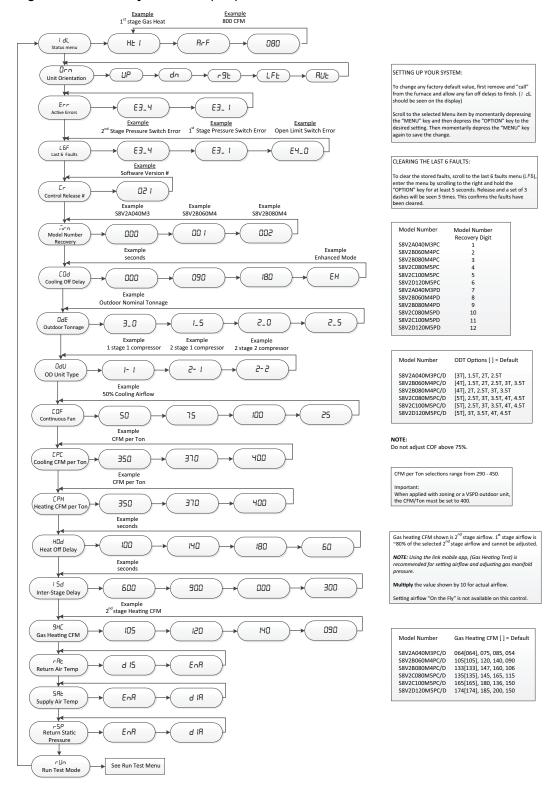

Figure 72. Run test mode

Run Test Mode:

To enter Run Test Mode, scroll to run using the Menu key, then push the option key. The LED will flash run three times, then begin the test.

To exit the test mode, momentarily push the Menu key, cycle power to the furnace, or make a valid thermostat call for capacity or fan.

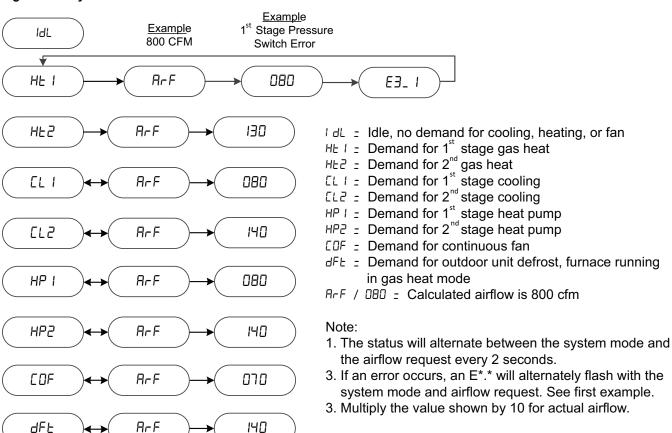

Sequence of Run Test Mode

- ระบุนะกระ 5. กณะกระหน่า ร.ป. 1 -Turns the inducer on in 1st stage for 30 seconds
- r∐2 Turns on the inducer on 2nd stage for 30 seconds
- r 以3 Turns the igniter on for 10 seconds
- r UY Turns the circulating blower on 1^{st} stage compressor speed for 10 seconds r US Turns the circulating blower on 2^{nd} stage compressor speed for 10 seconds r US Turns the circulating blower on 1^{st} stage gas heat speed for 10 seconds
- r ป่า Turns on the circulating blower on 2nd stage gas heat speed for 10 seconds

The above sequence will repeat two more times unless the Run Test Mode is exited, see above.

Important: The Run Test Mode does not test fire the furnace or bring the outdoor unit on. It is designed to allow the technician to observe each mode to ensure the IFC, inducer, igniter and circulating blower are performing as intended.

Fault Code Recovery

Fault Code Recovery

- 1. To view the last 6 faults, press the "Menu" key until the "Last 6 Faults" (£5F) menu appears.
- 2. Enter the menu by pressing the "Option" key.
- 3. The last 6 faults can be viewed.

Clearing the Last 6 Faults

- 1. To clear the last 6 faults, press the "Menu" key until the "Last 6 Faults" (L5F) menu appears.
- 2. Enter the menu by pressing the "Option" key.

- 3. Hold the "Option" key for at least 5 seconds.
- 4. Release and a set of 3 dashes with be seen 3 times. This confirms the faults have been cleared.

Resetting Factory Defaults

- 1. Display must be in Idle Mode.
- 2. Push the "Menu" and "Option" buttons at the same time for 15 seconds then release.
- 3. The 7 segment will flash "Fd" 3 times. This confirms the unit has been reset to the factory defaults.

Troubleshooting

The following pages include troubleshooting flowcharts in reference for the 2 Stage S8V2* family of furnaces only.

The information contained is for reference only and does not cover all scenarios or problems that may be encountered. Only qualified technicians should attempt to install, troubleshoot, or repair this appliance.

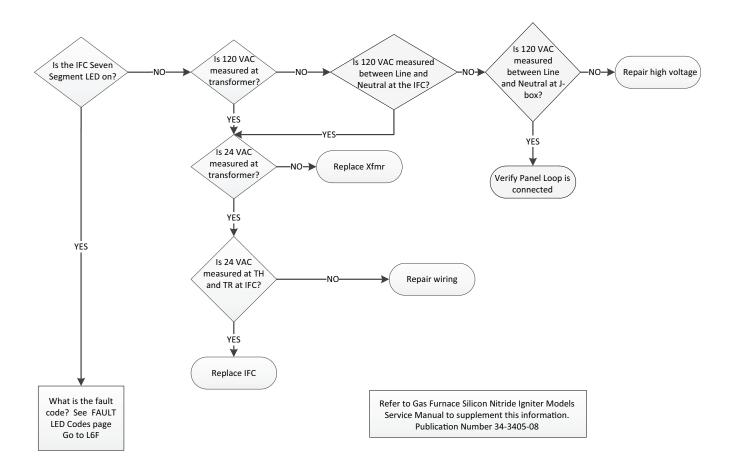

Failure to follow all cautions and /or warnings could result in personal or property damage, including death.

Figure 78. Troubleshooting flowchart index

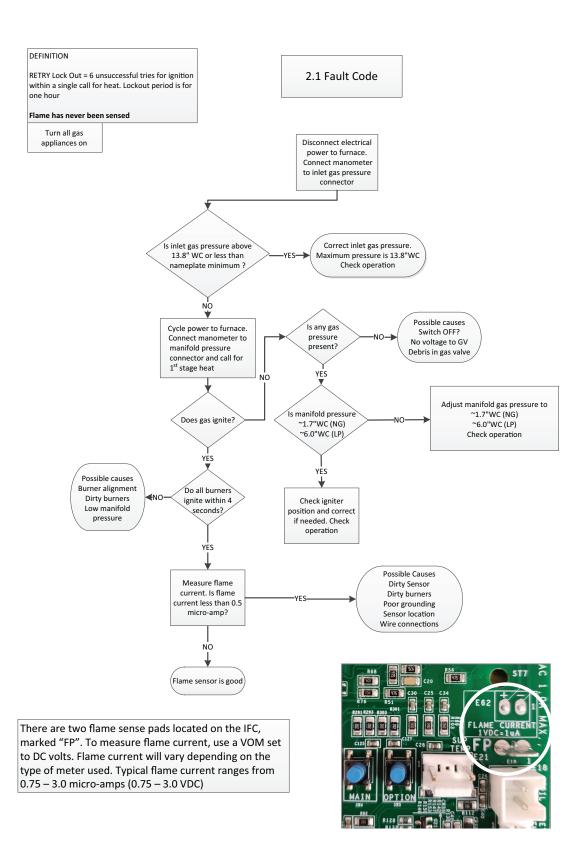

Error Codes

GETTING STARTED

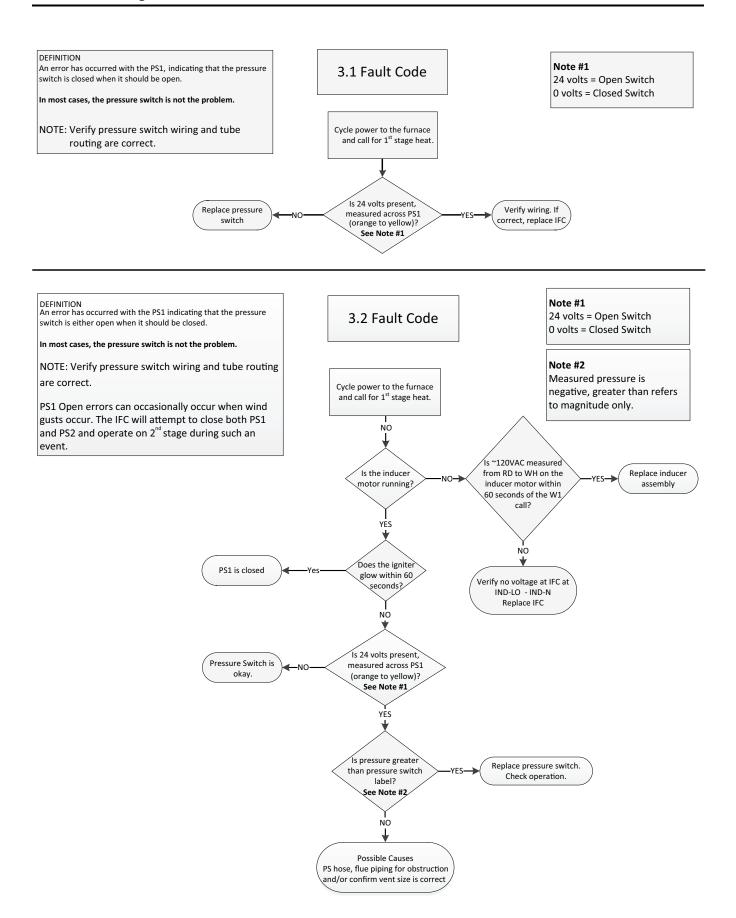

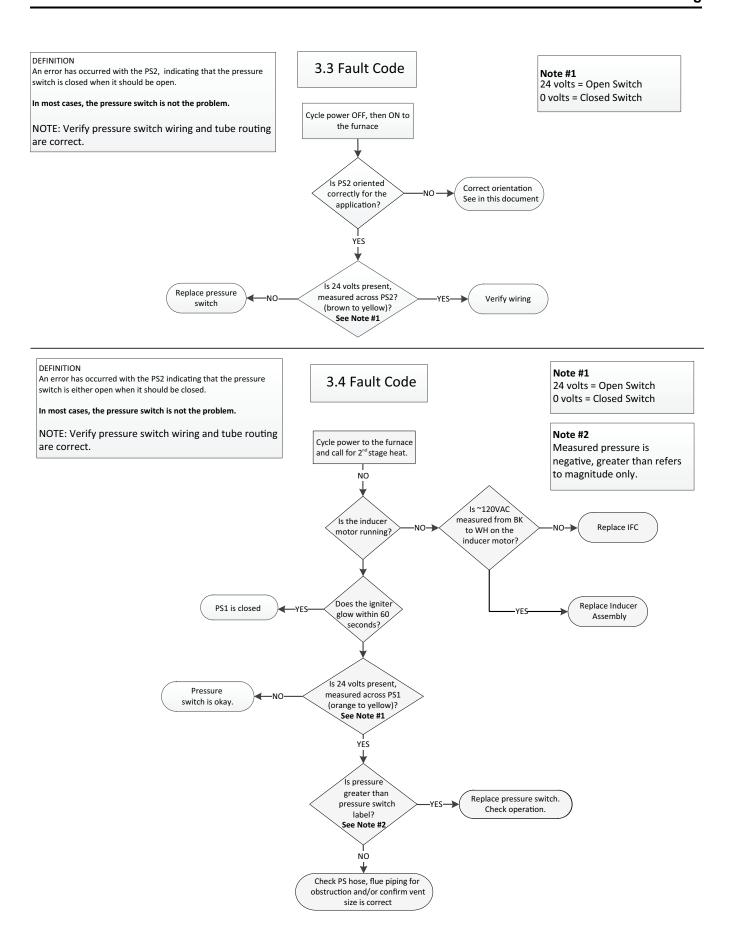

DEFINITION 1st Stage Gas Valve not energized when it should be 10 times within the same call for heat . 24VAC not sensed on MVL 10 times

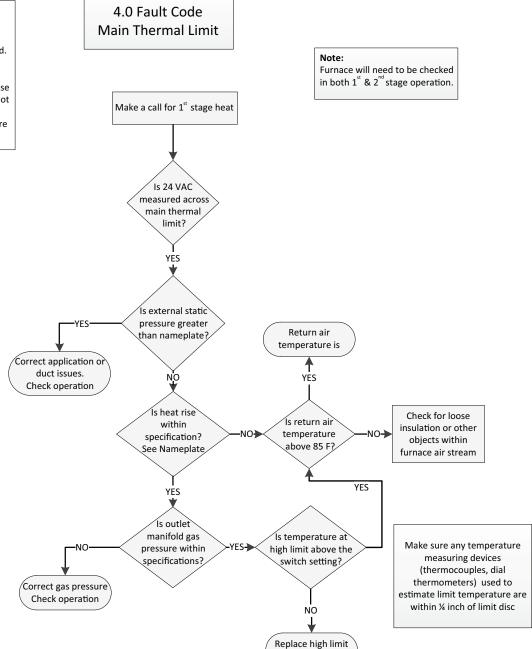

DEFINITION

Limit switches are safety devices that will open when an abnormal high temperature has been sensed. REMOVE ALL JUMPER WIRING TO SWITCHES!

Under no circumstances, shall these switches be left jumpered when not troubleshooting.

Verify filters and blower wheels are clean

switch

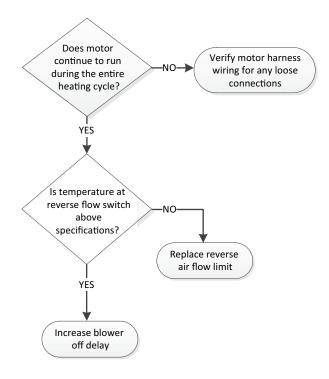

DEFINITION

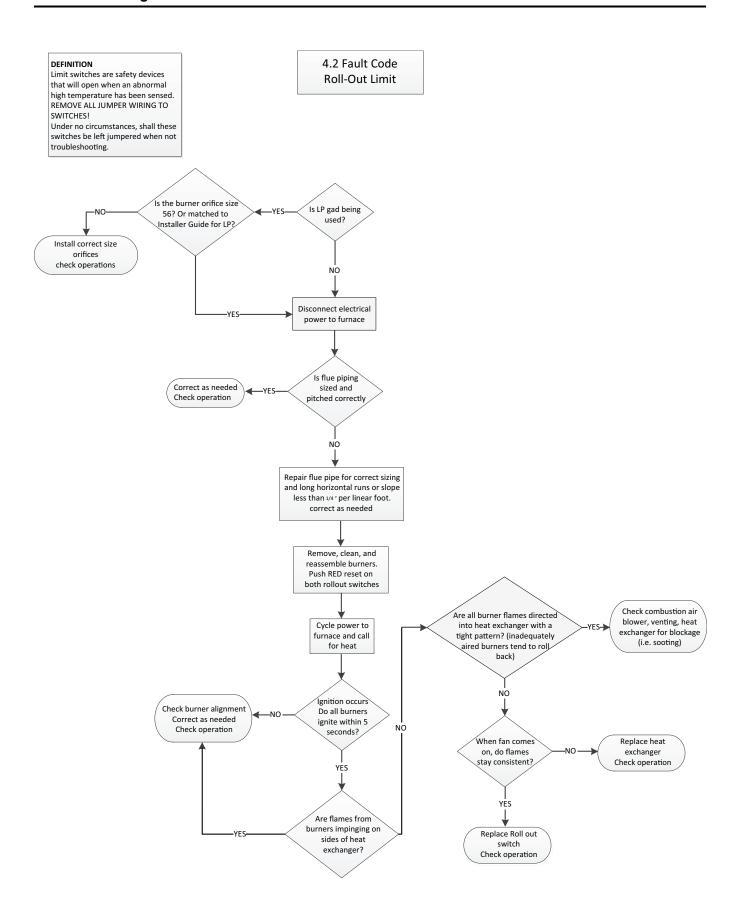

Limit switches are safety devices that will open when an abnormal high temperature has been sensed. REMOVE ALL JUMPER WIRING TO SWITCHES!

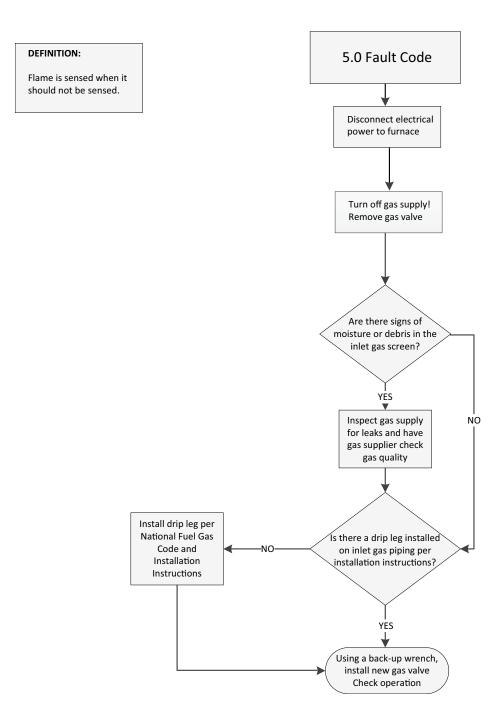

Under no circumstances, shall these switches be left jumpered when not troubleshooting.

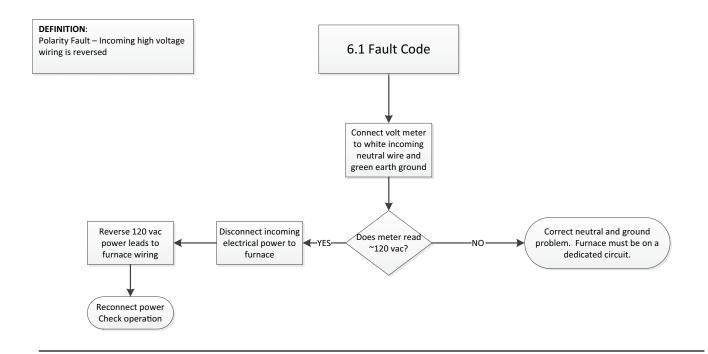

Verify filters and blower wheels are clean

4.1 Fault Code Open Reverse Air Flow Limit

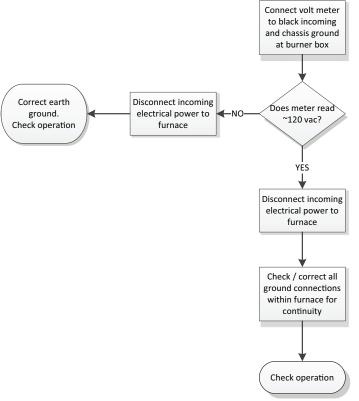

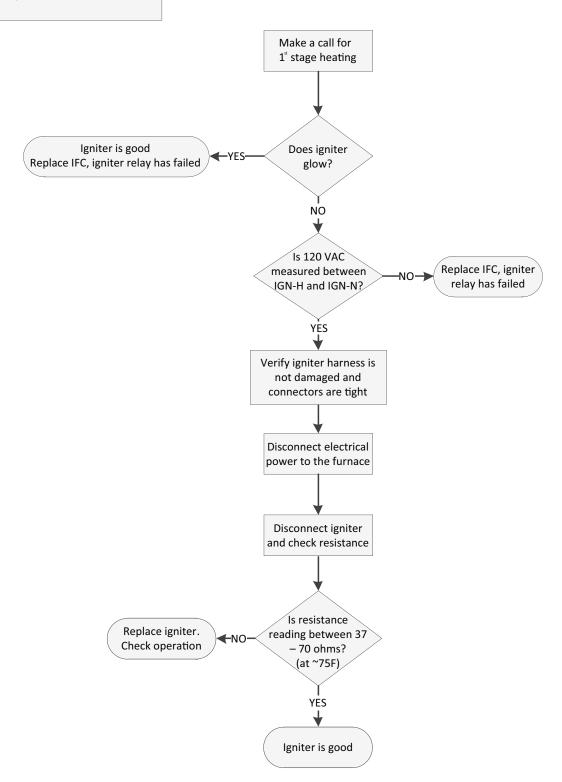

6.2 Fault Code

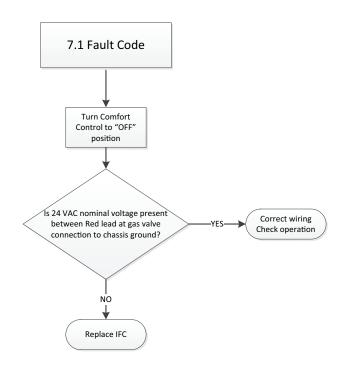

Igniter Relay Fault – The control board has sensed that the igniter relay has stuck closed

igniter Fault – The control board has sensed that the igniter circuit is open or shorted.

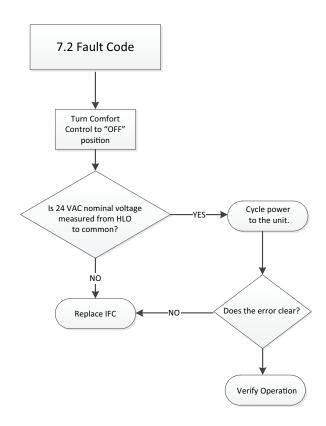

6.3 Fault Code

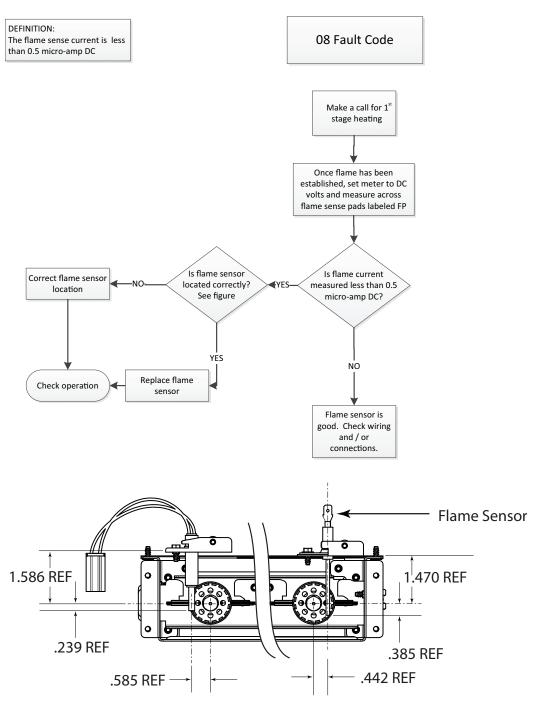

DEFINITION: External Gas Valve Circuit Error (24 volts is present when it should not be present)

DEFINITION: The HLO (High Limit Out) relay on the IFC is stuck ON

There are two flame sense pads located on the IFC, marked "FP". To measure flame current, use a VOM set to DC volts. Flame current will vary depending on the type of meter used. Typical flame current ranges from 0.75 - 3.0 micro-amps (0.75 - 3.0 VDC)

Definition:

The IFC has detected that internal gas valve relays have failed.

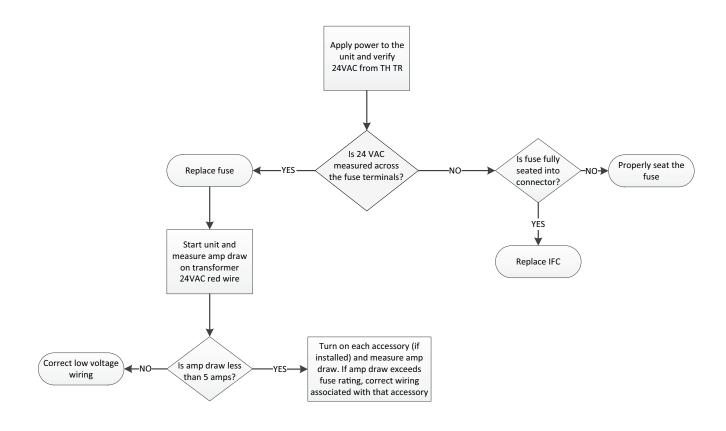

11 Fault Code

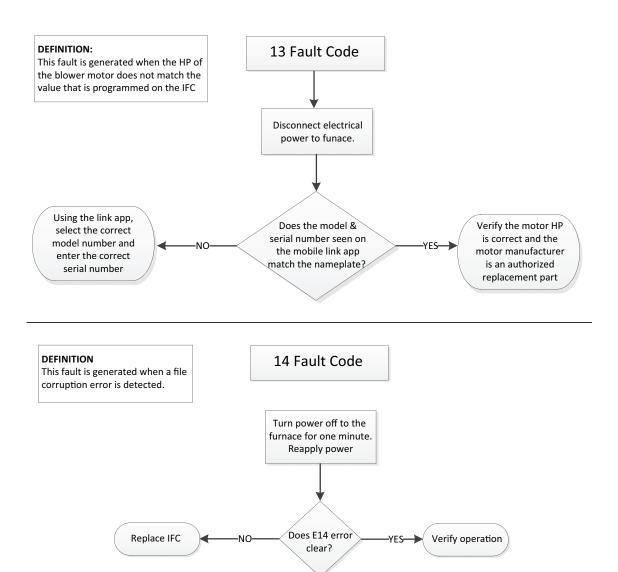

Verify all wiring Replace IFC

Definition:

The onboard 5 amp fuse is open or missing.

12 Fault Code

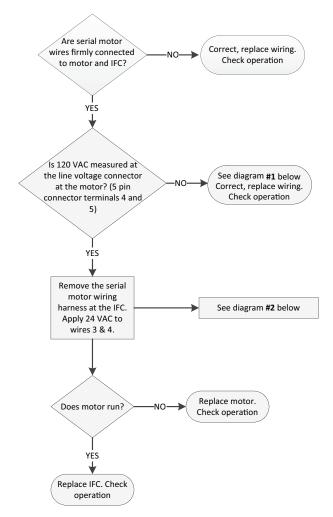

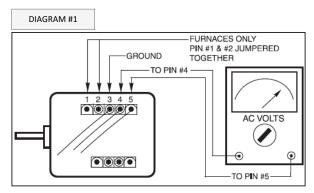

This fault is most likely due to intermittent low voltage control wiring connections. Insure wiring is per the wiring diagram and connections are secure and fully seated.

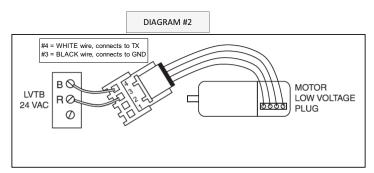

E17 Fault Code

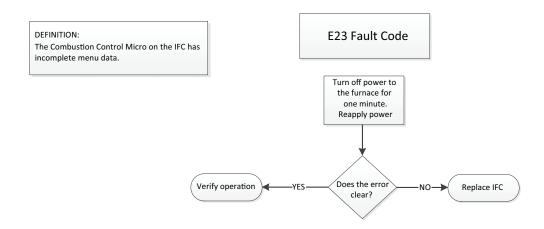

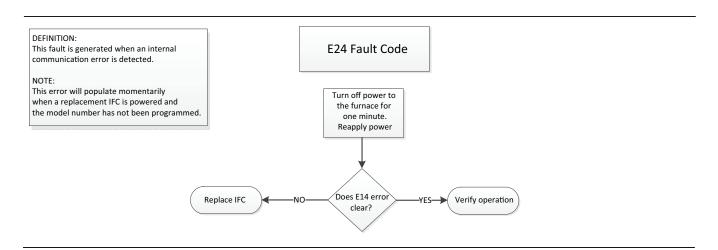

FTH: VS Serial Port Motors

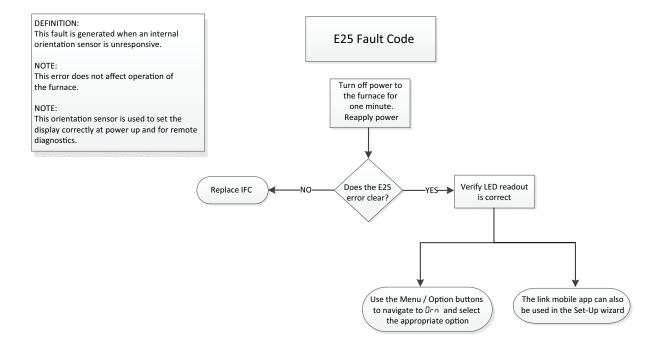

This fault is generated when the Return Static pressure transducer (BAYFURNPTKT accessory) is out of bounds or has been enabled and the wiring harness has not been connected to the IFC.

NOTE:

This error does not affect operation of the furnace.

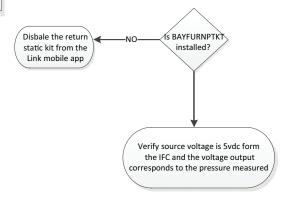

Important:

The Link mobile app must be used to enable or disable the pressure transducer. Disabled is the factory default.

E26 Fault Code

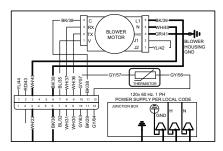

DEFINITION:

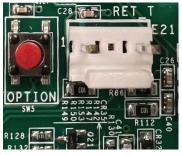

This fault is generated when the Return temperature sensor is Open / Shorted or when the sensor has been enabled but not installed/plugged in.

The sensor is part of the blower wiring harness.

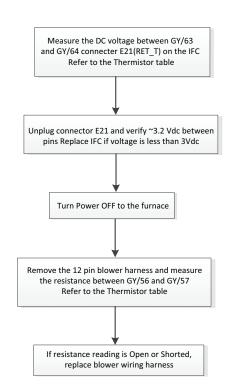

NOTE:

This error does not affect operation of the furnace. It can be cleared by disabling the Return Temperature using the mobile diagnostics app or by using the Menu / Option buttons. (24VAC mode only)

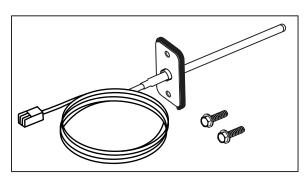

E27 Fault Code

This fault is generated when the Supply temperature sensor is Open / Shorted or when the sensor has been enabled but not installed/plugged in.

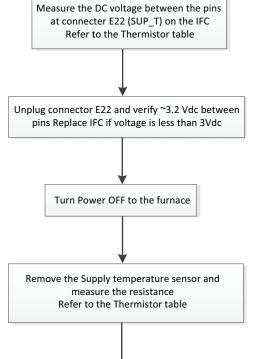

NOTE:

This error does not affect operation of the furnace. It can be cleared by disabling the Supply Temperature using the mobile diagnostics app or by using the Menu / Option buttons. (24VAC mode only)

E28 Fault Code

If resistance reading is Open or Shorted, replace the Supply temperature sensor BAYSENC360

Sequence of Operation

Note: The seven-segment LED readout is based on thermostat input. A simultaneous call for W1 and W2, the seven-segment LED will read "HŁ I", the IFC will process the call for 1st stage heat, then transition to "HŁZ" after the interstage delay timing has completed.

ACC1 (EAC) and ACC2 (HUM) Timing

- EAC relay closes approximately 2 seconds after the blower motor starts.
- EAC relay opens when the blower motor stops.
- HUM relay closes on any heating call (HP/Gas) approximately 1 second after the blower motor starts.
- HUM relay opens when the heating call (HP/Gas) is removed.

1st Stage Gas Heating

- R W1 contacts close on the thermostat sending 24vac to the W1 low voltage terminal of the IFC. Technician should read 24vac from W1 to B/C. The seven-segment LED will read: Hb I
- 2. The IFC performs a self-check routine and then confirms that the:
 - a. Flame roll-out switches (FRS) 1 and 2, main thermal limit (TCO), and any reverse air flow (RAF) switches are closed by sending 24vac out the HLO terminal and monitoring the HLI input.
 - Pressure switch 1 (PS1) and pressure switch 2 are open by sending 24vac out the PSO terminal and monitoring the PS1 and PS2 inputs.
- 3. After steps a and b are confirmed, the inducer relay is closed energizing the inducer motor.
- 4. As the inducer ramps up, PS1 will close.
- Note: The inducer motor starts on high speed for approximately 6 seconds, then switches to low speed. If PS1 does not close within 60 seconds, the control will report a E3.2 error and increase the inducer to high speed in an attempt to close PS1 and PS2. In this error state, 2nd stage heat will operate with a W1 call only. When PS1 closes, the igniter relay on the IFC will close and the igniter is energized. The igniter warm up is approximately 17 seconds
- After the igniter warm up, the 1st stage gas valve relay is closed, which energizes the 1st stage gas valve solenoid to allow ignition.
- The first burner will ignite, and flame will crossover to the remaining burners, establishing current to the flame sensor. Proof of flame must be established within 4 seconds.

- Note: There are two flame sense pads located on the IFC marked as "FP". To measure the flame current, use a VOM set to DC volts. 1VDC = 1 micro-amp. Flame current will vary depending on the type of meter used. Typical flame current ranges from 0.75 3.0 micro-amps (0.75 3 VDC).
- 7. Once flame sense has been established, a timer on the IFC starts, and the indoor blower will energize at 1st stage speed after the blower "Heat On Delay" has completed. The seven-segment LED for example will alternately read:
- Ht I = Gas heating, stage 1
- ArF = Airflow
- DBD = 800 calculated cfm (value shown x 10)
- 8. When the temperature raises enough to satisfy the thermostat setting, contacts R-W1 will open.
- The gas valve relay will open, closing the gas valve.
 The inducer will continue to run for approximately 5 seconds to remove any combustion byproducts from inside the furnace.
- 10. The indoor blower continues to run to remove heat from the heat exchangers. The blower off time is field adjustable through the IFC menu setup option. The seven-segment LED will read I dL = Idle, no thermostat demand.

2nd Stage Gas Heating

1. See sequence of operation for 1st stage gas heating operation above (steps 1 to 8)

Note: 2nd stage heating cannot operate without 1st stage operation.

- R-W2 contacts close on the thermostat sending 24vac to the W2 low voltage terminal of the IFC. Technician should read 24vac from W2 to B/C. The sevensegment LED will read HE2.
- 3. The IFC energizes the 2nd stage inducer relay. The inducer is energized on high speed, and the second stage gas valve relay on the IFC closes, energizing second stage gas valve. The indoor blower motor will ramp up to the 2nd stage gas heating speed. The seven-segment LED for example will alternately read:
- Ht2 = Gas heating, Stage 2
- ArF = Airflow
- 4. The IFC monitors PS2 for closure and if PS2 does not close within 45 seconds, a PS2 open error will be declared and the furnace will operate in 1st stage. If PS2 closes, 2nd stage gas heating will continue until the thermostat R-W2 contacts open.

- Note: If PS2 does not close within the 45 second time, the IFC will wait 10 minutes and repeat steps 3 and 4. If on the third attempt during the same heating call, PS2 does not close within the 45 second proving time, the unit will run in 1St stage until the thermostat contacts R-W2 open.
- When the temperature raises enough to satisfy the thermostat setting, contacts R-W2 will open, the 2nd stage gas valve will close, the indoor blower motor will ramp down to 1st stage, and the unit will continue to run until R-W1 contacts open
- 6. When the temperature raises enough to satisfy the thermostat setting, contacts R-W1 will open.
- The gas valve relay will open, closing the gas valve.
 The inducer will continue to run for approximately 5 seconds to remove any combustion byproducts from inside the furnace.
- 8. The indoor blower continues to run to remove heat from the heat exchangers. This blower off time is field adjustable through the IFC menu setup option. The seven-segment LED will read | dL = Idle, no thermostat demand.

Single Stage Cooling

 R-Y1-G contacts on the thermostat close sending 24vac to the Y1 and G low voltage terminals on the IFC. The technician should read 24vac between Y1-B/ C and between G-B/C.

Note: The factory supplied Y1-O jumper must remain in place for proper seven-segment LED readout, and furnace operation. If removed, the seven-segment LED will read HP 1.

- 2. 24vac is sent to the OD unit via thermostat wiring.
- 3. The indoor blower ramps to the cooling airflow. The seven-segment LED for example will alternately read:
- EL I = Cooling, Stage 1
- ArF = Airflow
- ID5 = 1050 calculated cfm (value shown x 10)
- 4. When the temperature is lowered enough to satisfy the thermostat setting, contacts R-Y-G will open.
- The OD unit shuts off and the indoor blower shuts off, unless a blower "Cool Off Delay" has been enabled in the IFC setup menu options. The seven-segment LED will read IdL = Idle, no thermostat demand.

Two Stage Cooling

- 1. See sequence of operation for Single stage cooling operation above (steps 1 to 3).
- 2. R-Y2 contact on the thermostat close sending 24vac to Y2 low voltage terminal on the IFC. Technician should read 24vac between Y2 and B/C.
- 3. 24vac is sent to the OD unit via thermostat wiring.
- 4. The indoor airflow ramps to 2nd stage airflow. The seven-segment LED for example will read:

- [L2 = Cooling, Stage 2
- ArF = Airflow
- IBD = 1800 calculated cfm (value shown x 10)
- When the temperature is lowered enough to satisfy the thermostat setting, contacts R-Y1-Y2-G will open.
- 6. The OD unit shuts off and the indoor blower shuts off, unless a blower "Cool Off Delay" has been enabled in the IFC setup menu options. The seven-segment LED will read | dL = Idle, no thermostat demand.

Single Stage Heat Pump

 R-Y1-G contacts on the thermostat close sending 24vac to the Y1 and G low voltage terminals on the IFC. Technician should read 24vac between Y1-B/C and between G-B/C.

Note: The factory supplied Y1-O jumper must be removed for proper seven-segment LED readout and furnace operation. If left in place, the seven-segment LED will read ΣΕ /.

- 2. 24vac is sent to the OD unit via thermostat wiring.
- 3. The indoor blower ramps to the cooling airflow. The seven-segment LED for example will alternately read:
- HP I = Heat Pump Heating, Stage 1
- ArF = Airflow
- ID5 = 1050 calculated cfm (value shown x 10)
- 4. When the temperature is lowered enough to satisfy the thermostat setting, contacts R-Y-G will open.
- 5. The OD unit shuts off and the indoor blower shuts off, unless a Cool Off Delay has been enabled in the IFC setup menu options. The seven-segment LED will read | dL = Idle. no thermostat demand.

Two Stage Heat Pump

- 1. See sequence of operation for Single stage cooling operation above (steps 1 to 3).
- 2. R-Y2 contact on the thermostat close sending 24vac to Y2 low voltage terminal on the IFC. Technician should read 24vac between Y2 and B/C.
- 3. 24vac is sent to the OD unit via thermostat wiring.
- 4. The indoor airflow ramps to 2nd stage airflow. The seven-segment LED for example will read:
- HP2 = Cooling, Stage 2
- ArF = Airflow
- ### = 1800 calculated cfm (value shown x 10)
- 5. When the temperature is raised enough to satisfy the thermostat setting, contacts R-Y1-Y2-G will open.
- 6. The OD unit shuts off and the indoor blower shuts off, unless a blower off delay has been enabled in the IFC setup menu options. The seven-segment LED will read I dL = Idle, no thermostat demand.

Periodic Servicing Requirements

- 1. General Inspection Examine the furnace installation annually for the following items:
 - All flue product carrying areas external to the Furnace (i.e. chimney, vent connector) are clear and free of obstruction. A vent screen in the end of the Vent (flue) Pipe must be inspected for blockage annually, if applicable.
 - The vent connector is in place, slopes upward and is physically sound without holes or excessive corrosion.
 - The return air duct connection(s) is physically sound, is sealed to the Furnace and terminates outside the space containing the Furnace.
 - d. The physical support of the Furnace should be sound without sagging, cracks, gaps, etc., around the base so as to provide a seal between the support and the base.
- Filters Filters should be cleaned or replaced (with high velocity filters only), monthly and more frequently during high use times of the year such as midsummer or midwinter.
- 3. Blowers The Blower size and speed determine the air volume delivered by the Furnace. The Blower motor bearings are factory lubricated and under normal operating conditions do not require servicing. Annual cleaning of the Blower wheel and housing is recommended for maximum air output, and this must be performed only by a qualified servicer or service agency.
- 4. Igniter This unit has a special hot surface direct ignition device that automatically lights the burners. Please note that it is very fragile and should be handled with care. ! CAUTION Do NOT touch igniter. It is extremely hot.
- 5. Burner Gas burners do not normally require scheduled servicing, however, accumulation of foreign material may cause a yellowing flame or delayed ignition. Either condition indicates that a service call is required. For best operation, burners must be cleaned annually using brushes and vacuum cleaner. Turn off gas and electric power supply. To clean burners, remove burner bottom plate (2 screws) and bottom burner bracket (2 screws). Twist burner towards slot, lift, and push forward away from orifice. Remove burners.

Alternate method — Remove manifold assembly, bottom burner plate, and bottom burner bracket. Remove burners.

Notes:

- Be careful NOT to break igniter when removing burners
 - Clean burners with brush and/ or vacuum cleaner. Reassemble parts by reversal of the above procedure.
- Natural gas units should not have any yellow tipped flames. This condition indicates that a service call is required. For best operation, burners must be cleaned annually using brushes and vacuum cleaner.
- On Propane units, due to variations in BTU content and altitude, servicing may be required at shorter intervals.
- 6. Heat Exchanger/ Flue Pipe These items must be inspected for signs of corrosion, and/ or deterioration at the beginning of each heating season by a qualified service technician and cleaned annually for best operation. To clean flue gas passages, follow recommendations below:
 - a. Turn off gas and electric power supply.
 - Inspect flue pipe exterior for cracks, leaks, holes or leaky joints. Some discoloration of PVC pipe is normal
 - c. Remove door from Furnace.
 - d. Inspect around insulation covering flue collector box. Inspect induced draft Blower connections from recuperative cell and to the flue pipe connection.
 - e. Remove burners. (See 5. Burner)
 - f. Use a mirror and flashlight to inspect interior of Heat Exchanger, be careful not to damage the Igniter, Flame Sensor or other components.
 - g. If any corrosion is present, the Heat Exchanger should be cleaned by a qualified service technician.
 - h. After inspection is complete replace burners and Furnace door.
 - Restore gas supply. Check for leaks using a soap solution. Restore electrical supply. Check unit for normal operation.
- Cooling Coil Condensate Drain If a cooling coil is installed with the Furnace, condensate drains should be checked and cleaned periodically to assure that condensate can drain freely from coil to drain. If condensate cannot drain freely water damage could occur.

Notices

FCC Notice

Contains FCC ID: WAP3025

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

- 1. This device may not cause harmful interference.
- 2. This device must accept any interference received, including interference that may cause undesired operation. The antenna(s) used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be collocated or operating in conjunction with any other antenna or transmitter. This equipment has been tested and found to comply with the limits for Class B Digital Device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no quarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures.
- · Reorient or relocate the receiving antenna

- Increase the separation between the equipment and receiver
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected
- Consult the dealer or an experienced radio/TV technician for help

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

IC Notice

Contains IC ID: 7922A-3025

This device complies with Industry Canada license exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Le present appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de license. L'exploitation est autorisée aux deux conditions suivantes: (1) l'appareil de doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

About Trane and American Standard Heating and Air Conditioning Trane and American Standard create comfortable, energy efficient indoor environments for residential applications. For more information, please visit www.trane.com or www.americanstandardair.com.
The manufacturer has a policy of continuous data improvement and it reserves the right to change design and specifications without notice. We are committed to using environmentally conscious print practices.
